Getting started

Easy Data Transform data wrangling software for Windows and Mac.

1 Getting started

1.1 Introduction

Easy Data Transform allows you to quickly transform table and list data into new and more useful forms, without programming. The step-by-step visual transformation is quicker, more interactive, more repeatable and less error prone than other approaches.

Please take a couple of minutes to read the <u>Quick Start Guide</u>.

1.2 System requirements

The suggested requirements for running this software are:

- Operating system: macOS 13.x to 10.13.
- Screen resolution: 1280x720 pixels or better.

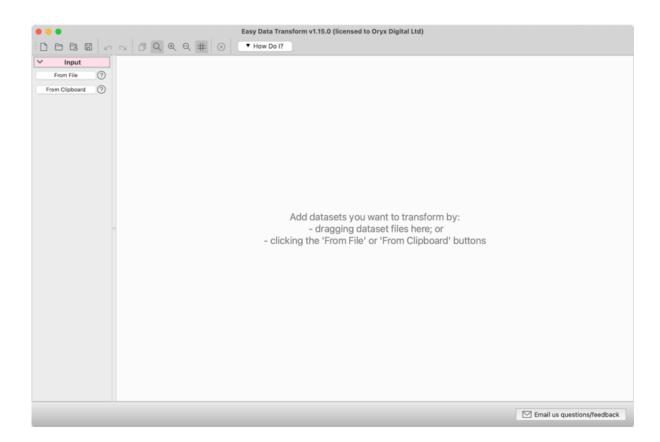

If your operating system is more recent than the above, check our website to find a compatible version of Easy Data Transform.

You may be able to run the software satisfactorily on lower specification systems or more recent operating systems, but we can't guarantee it. If in doubt, try running an unlicensed trial version before you buy a license.

1.3 Quick start guide

This is a quick tour of some of Easy Data Transform's features. It should only take a few minutes to complete.

Start Easy Data Transform. If the **Free Trial** window appears, click **Continue free trial**. If the Getting Started window appears, click **I got this!** (or you will just end up back on this page). You should now see the main window.

Make sure that **Auto Run** tool bar button is checked (pressed in), so that any changes you make are processed automatically after a short delay.

Drag a data file you want to transform onto Easy Data Transform. For example a CSV file or an Excel .xlsx/.xls file. XML, JSON, fixed width, plain text and vCard formats are also supported.

insert	0								afg	1989				
Interpolate	\bigcirc							0	arg	1909	30			_

Notice that the available transforms are shown in the **Left** pane and the selected dataset is shown in the **Right** pane.

In the **Right** pane, you can check **has header**, depending on whether you want to treat the first row of the dataset as a header. For some input formats, such as JSON and XML, the header is added automatically.

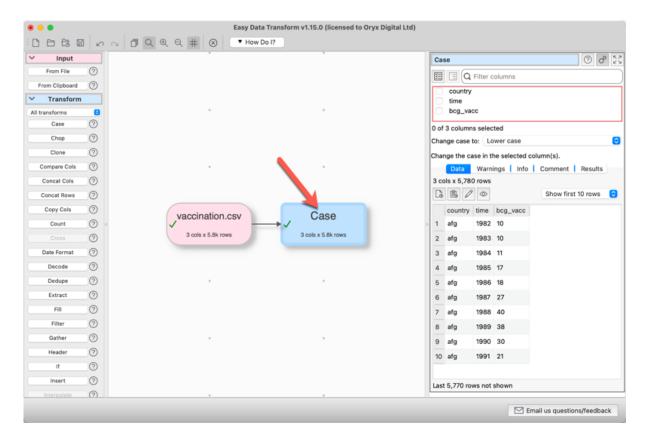

vaccinati	on.csv 🕜 🔗	K 7 K 3

Count	try time bcg_vacc	-

Transforms are shown in the **Left** pane. Hover over the transforms to see tooltips explaining what they do. Click on the **?** next to a transform button for more details.

Ensure the input item is selected and click on the **Case** transform button to change the case of your data.

0 8 8 8	0	0	QQ	Q #	\otimes	How Do I?								
/ Input								vac	cination.	csv			0	e
From File	0								File: /U:	sers/an	dyb/Desktop	/vaccination.cs

if	0							6	afg	1987	27			
Insert	0							7	afg	1988	40			
	0							8	afg	1989	38			

A Case transform item will now be added.

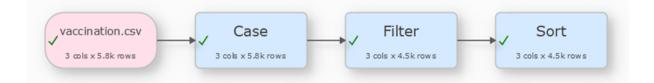

12

In the **Right** pane, check one of the columns and set **Change case to** to **Upper case**. All the text in that column will now be converted to upper case once you have stopped making changes in the **Right** pane. You don't have to click a 'run' button.

You can create a sequence of transforms to easily perform complex manipulations.

Some transforms require more than one input dataset. For example, to stack two datasets, one on top of the other:

- Select **File>New** to start again. Don't save the changes.
- Drag two data files onto the **Center** pane.
- Select both input items (by dragging a box around them or using Cmd+click).
- Click the Stack transform button (you may need to scroll the Left pane to see the button).

Note that the vertical (Y) position of the inputs affects the order the datasets are stacked. Try swapping the two inputs around and re-select **Stack** to see the effect.

Any changes to input options will cause the input file to be automatically re-read. Any changes to input datasets or transform options will be automatically propagated 'downstream'.

To export your transformed dataset to a file or the clipboard, view it in a local editor or see it with whitespace displayed, click on the appropriate button in the **Right** pane.

You can save your transforms to a .transform document to use again with **File>Save**.

Have a play!

Tips:

- You can also watch a short introductory video.
- Check the **show advanced** check box in the **Left** pane to see all the available transforms.
- You can paste in data from the clipboard (for example, a table from a web page or Word document) using the **From Clipboard** button in the **Left** pane.
- Transforms such as **Compare Cols**, **Filter**, **If** and **Sort** take account of dates, numbers and text. You can define what <u>date formats</u> to recognize in the <u>Preferences window</u>.
- New columns are always added to the right of a dataset.
- Comparisons of text are sensitive to case, unless stated otherwise. E.g. "CASE", "case" and "Case" are treated differently.
- Comparisons of text are sensitive to whitespace (e.g. spaces and tabs), unless stated otherwise. You can use the <u>Whitespace</u> transform to remove unnecessary whitespace.
- The contents of input and output data files are <u>not</u> saved in an Easy Data Transform .transform file, only their locations.
- As well as stacking two datasets, you can also <u>Join</u> them, side-by-side, if they have a common ('key') column.
- You can insert a new transform between existing items by selecting the connection between the items and then adding the transform.
- To be more productive with Easy Data Transform see expert tips.

We are interested in your feedback, so please contact us to <u>ask a question</u>, <u>report a bug</u> or <u>request an enhancement</u>.

Reference

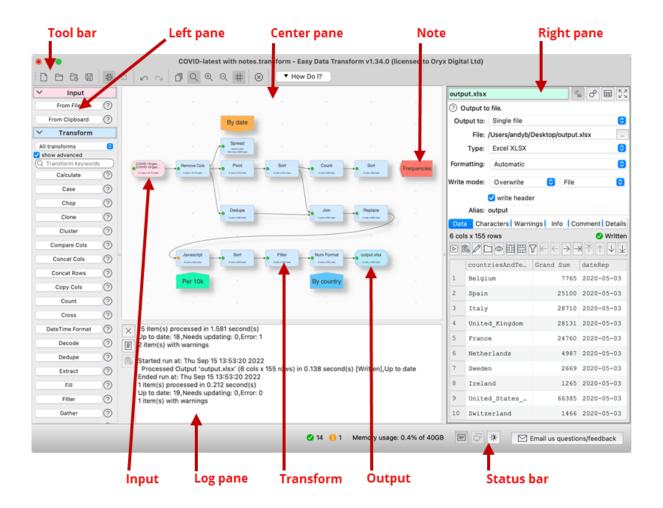

2 Reference

2.1 User Interface

2.1.1 Main window

The Main window comprises:

- Main menu
- Tool bar
- Left pane
- Center pane
- <u>Right pane</u>
- Log pane
- Status bar

You can split the **Right** pane onto a separate monitor (if available) by selecting **View>Two Screen Mode**.

2.1.2 Left pane

The **Left** pane shows all the available actions you can perform. Which actions are visible will depend on what is shown in the <u>Center pane</u>. Which actions are enabled depends on what is selected in the **Center** pane.

2.1.3 Center pane

The **Center** pane show the inputs, transforms and outputs you are using to transform your data.

2.1.4 Right pane

The **Right** pane shows details of an input, transform or output item you have selected in the <u>Center pane</u>.

2.1.5 Log pane

The **Log** pane shows a text representation of processing on the current .transform file. It shows a maximum of 5000 rows.

- Click the imes button to clear all text in the pane.
- Click the 🗏 button to select all text in the pane.
- Click the 🗟 button to copy selected text in the pane to the clipboard.
- Select **View>Log** (or the corresponding status bar button) to hide/show the pane.

2.1.6 Preferences window

General tab

Check **give option to disable outputs when opening a .transform file** if you want the option to disable any outputs with write mode set to overwrite or append. This prevents accidentally writing over existing files.

Check use native file windows to use the native Mac file open/save windows.

Check **make a sound when processing completed** if you want to make a system sound every time processing is completed.

Set **At start-up** depending on what you want to happen when Easy Data Transform starts.

Set **Opening a transform with auto run** according to what you want to do when you open a .transform file <u>with auto-run enabled</u>:

- Leave auto run enabled to leave auto run enabled. This could be risky if you are <u>opening</u>. <u>transform files of unknown provenance</u>.
- **Prompt to disable auto run** to prompt you whether to disable auto run (you can reenable it).

- Disable auto run to disable auto run (you can re-enable it).
- **Prompt to disable outputs** to prompt you whether to disable any output items that are not already disabled (you can re-enable them).
- **Disable outputs** to disable any output items that are not already disabled (you can reenable them).

Note that this setting is ignored when using the <u>-cli command line argument</u>.

Set **User interface theme** to **Automatic** to follow the theme of the operating system or override it by setting **Light** or **Dark**. This is only available if your operating system supports a dark theme. Changing **User interface theme** does not update the <u>Center pane colors</u>. You can also toggle between themes using a <u>keyboard shortcut</u>.

Set **Tool bar icon size** to the size of the icons you wish to display in the tool bar.

Set **Copy data to clipboard text/plain as** according to how you want data to be formatted, when it is copied to the clipboard with MIME type text/plain.

- **Comma Separated Value** uses comma as a column delimiter and quotes carriage returns, commas and quotes within data.
- **Tab Separated Value** uses tab as a column delimiter and converts carriage returns and tabs to spaces within data.
- Plain text outputs without any column delimiter.

Data is also copied to the clipboard with MIME type text/csv in Comma Separated Value format and to MIME type text/html as an HTML fragment.

Set Optimize processing for to:

- **Minimum memory use** to use memory compression to reduce the memory used. This is usually recommended. It works best when columns contain repeated values.
- **Maximum speed** to turn off memory compression. This might be faster, but uses a lot more memory. It might also be <u>slower</u> if the memory required is more than your RAM. It might also cause **Maximum memory usage** to be exceeded.

Set **Maximum memory usage** to the maximum amount of memory that you want Easy Data Transform to be allowed to use. If this limit is exceeded the program will try to exit cleanly.

Set **Right pane processing delay** depending on how long you want to wait after changes in the **Right** pane before starting processing, when **Run>Auto Run** is checked. Setting the value to 0 is generally not recommended, as this means that every single click in the **Right** pane will cause processing.

Set **Zoom wheel behavior** according to how you want the mouse wheel to work in the **Center** pane. Hold down the Option key while moving the mouse wheel to switch between zoom and scroll. If **Scroll direction: Natural** is checked in your Mac **Settings>Mouse** then the directions will be reversed.

User interface font shows the font used for the application user interface, apart from data tables (see below). Click **Choose...** to choose a new font. Click **Default** to set it back to the operating system default.

Data table font shows the font used in the data tables in the **Right** pane. Click **Choose...** to choose a new font. You might prefer a monospaced (fixed width) font such as Monaco or Courier New. Click **Default** to set it back to the operating system default.

The **Locale** language and country setting <u>affects how some numbers and dates are displayed</u>. Consequently it may have an effect on some transforms. It does not change the language of the user interface, which is English only.

Dates tab

Set **Supported date formats** to <u>the date formats you wish to recognize</u>. List the date formats in order of preference, with the most likely to be used first.

Click **Default (US)** to replace the current supported date formats with US defaults.

Click **Default (non-US)** to replace the current supported date formats with non-US defaults.

Input Extensions tab

Set the default file types corresponding to input file extensions. The order in which file extensions are shown is not significant.

Click in the **Extension** column and type to change an input file extension. The text will be trimmed of whitespace, converted to lower case and any '.' characters removed.

Click in the **Default type** column and change the drop-down list to change the file type to associate with an input file extension.

Click Add to add a new input file extension.

Click **Remove** to remove the selected input file extension(s).

Click **Default** to set the input file extensions back to the default setting.

Set **Block input from files with extensions** to a comma separated list of file extension that you want to block Easy Data Transform from reading from for <u>data security</u>. The case and the order in which file extensions are shown is not significant.

Output Extensions tab

Set the default file types corresponding to output file extensions. The order in which file extensions are shown is not significant.

Click in the **Extension** column and type to change an output extension. The text will be trimmed of whitespace, converted to lower case and any '.' characters removed.

Click in the **Default type** column and change the drop-down list to change the file type to associate with an output file extension.

Click **Add** to add a new output file extension.

Click **Remove** to remove the selected output file extension(s).

Click **Default** to set the output file extensions back to the default setting.

Set **Block output to files with extensions** to a comma separated list of file extension that you want to block Easy Data Transform from writing to for <u>data security</u>. The case and the order in which file extensions are shown is not significant.

Colors tab

Select a **Color scheme** for the **Center** pane. A **Preview** is shown in the **Preferences** window. Choose **Custom** to choose your own color scheme.

2.2 Input

2.2.1 Input data

You need to input data before you can transform it. Data can be input by:

- dragging a file onto the Center pane; or
- clicking the From File or From Clipboard button in the Left pane

Enter the file location in **File** or click the browse button. For Excel spreadsheets you also need to add a sheet name, e.g. 'MySpreadsheet.xlsx[Sheet1]'.

Easy Data Transform can input data from files in the following formats:

- delimited text file (e.g. <u>CSV</u> or <u>TSV</u>) with various delimiters
- Excel .xlsx or .xls
- <u>fixed width</u>
- <u>Plain text</u>

- JSON
- <u>vCard</u>
- <u>XML</u>

You can select the input item in the **Center** pane and change any related options in the <u>Right</u> pane.

vaccinatio	on.csv 🔗 🖽	
? Input fr	om file.	
File:	/Users/andyb/Dropbox/vaccination.csv	
Type:	Delimited text	٥
Delimiter:	Automatic	٢
Quoting:	Automatic	٥
Encoding:	Automatic	٥
Ignore:	First 0 row(s)	
	 Aas header trim whitespace simplify whitespace ignore empty rows watch file 	
Meta info:	Not added	٥
Alias:	vaccination	
Data	Warnings Info Comment Details	;
3 cols x 5,	780 rows 🥑	Read

Set **Type** to the file type. The default type will be set according to the file extension and the settings in the **Input Extensions** tab of the <u>Preferences window</u>.

For text files Easy Data Transform will treat CRLF, LF or CR control characters as line endings.

Easy Data Transform will make an intelligent guess at the:

- column delimiter and quoting for delimited text files (e.g. comma)
- column widths for fixed width text files
- text encoding for text files (e.g. UTF-8)
- presence of a header row in the data

But you can also do this manually by selecting the input item and changing the **Delimiter**, **Columns**, **Encoding** and **has header** fields in the <u>Right pane</u>.

Set **Ignore** to the number of rows you want to skip before you start inputting. Note that this takes place before any empty rows are removed by **Ignore empty rows**.

For delimited text you can:

- Set **Delimiter** to the delimiter character.
- Check **ignore repeated delimiters** if you want to treat 2 or more consecutive delimiters as a single delimiter.
- Set **Quoting** according to whether " quoting is used so that the delimiter can appear within values.

See delimited text for more details.

For fixed width set **Columns** to **Manual** to set column widths. See <u>fixed width</u> for more details.

For JSON or XML set **Format** to **Long (more rows)** or **Wide (more columns)** depending on how you want to treat arrays/repeat values. See <u>JSON</u> or <u>XML</u> for more details.

Check **trim whitespace** to trim any whitespace (e.g. tabs or spaces) off the start or end of data values.

Check simplify whitespace to:

- Replace any tabs or line feeds within data values with spaces.
- Replace non-standard spaces (such as non-breaking space, thin space etc) within data values with spaces.
- Remove carriage returns within data values.

Check **ignore empty rows** to remove any rows that have only empty values (whitespace is not considered empty).

Check **ignore empty columns** to remove any columns that have only empty values (whitespace is not considered empty). Header values are ignored when deciding if a column is empty.

Check **ignore hidden rows and columns** to remove any hidden rows or columns (Excel files only).

Check watch file if you want :

- **Run>Auto Run** selected: the input to automatically reload the file every time that Easy Data Transform detects that it has been changed.
- **Run>Auto Run** not selected: the input to be marked as 'Needs update' every time that Easy Data Transform detects that it has been changed.

Use **Meta info** if you wish to add some <u>meta information</u> about the input dataset, e.g. the name of an input file or the date it was created.

Use Alias to identify the file for batch processing.

To change the file being used by an input, select the input item and change the file location in the **Right** pane (e,g, by clicking the '...' browse file button), rather the disconnecting the input and connecting a new one. Otherwise column-related parameters downstream will be reset.

2.3 Transforms

2.3.1 Transform data

Transforms operate on datasets from <u>input data</u> or other transforms. Some transforms only have a single input (e.g. <u>Case</u>), some transforms have two inputs (e.g. <u>Join</u>) and some transforms have two or more inputs (e.g. <u>Stack</u>).

To create a transform, select one or more input and/or transform items in the <u>Center pane</u> and then click the appropriate button in the <u>Left pane</u>.

Select from the drop-down list in the **Left** pane to choose which types of transform are displayed, e.g. select **Merge Transforms** to show only transforms related to blending data.

Check the **show advanced** checkbox in the **Left** pane to see all available transforms.

You can select the transform item in the **Center** pane and change any options related to the transform (e.g. which columns it acts on) in the <u>Right pane</u>.

The transform will be updated automatically if any input or transform 'upstream' of it changes.

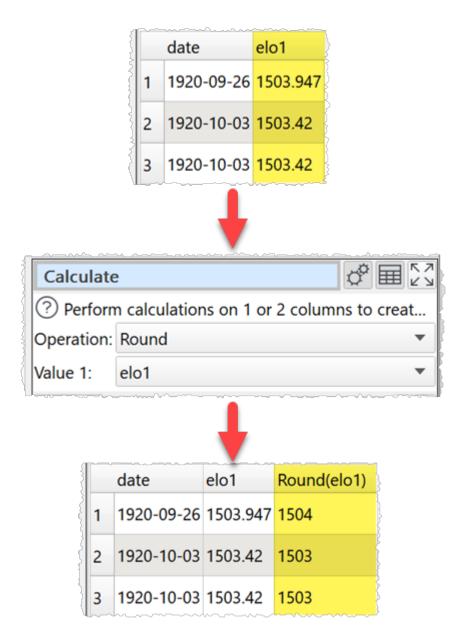

2.3.2 Calculate

Description

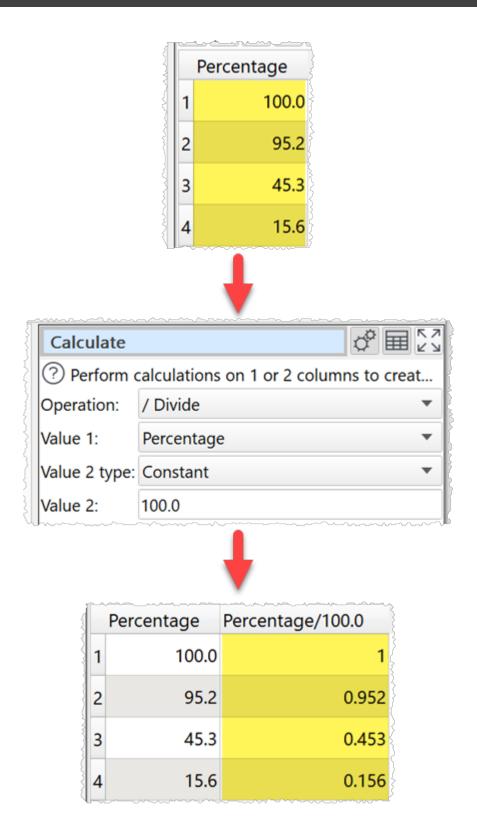

Performs a calculation on 1 or 2 columns and creates a new column.

Examples

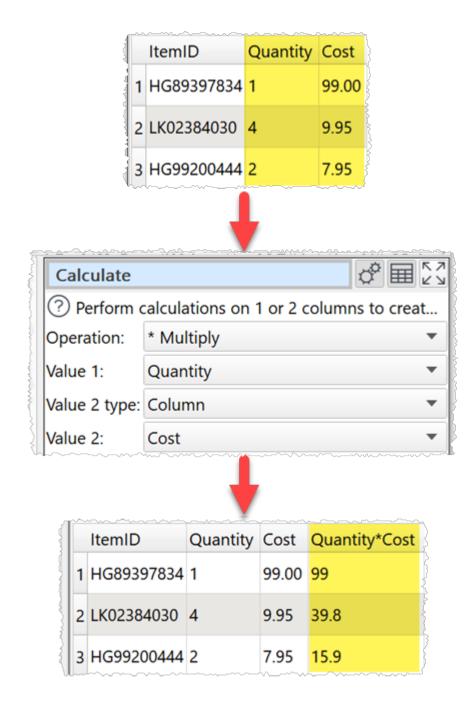

Round a column of numbers to the nearest integer:

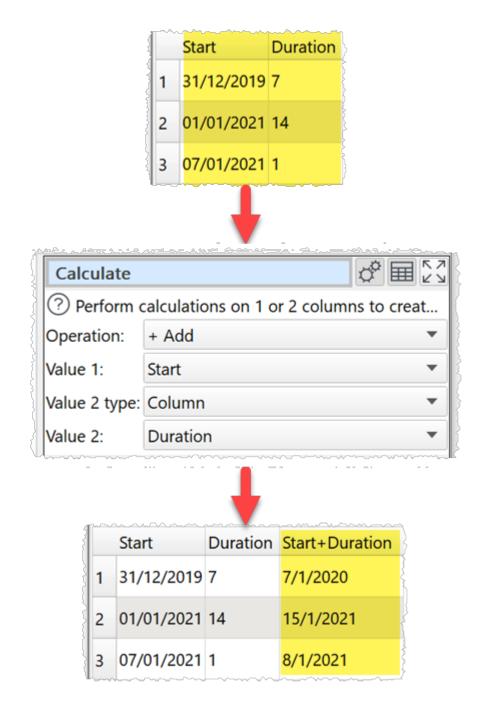

Divide a column of numbers by 100:

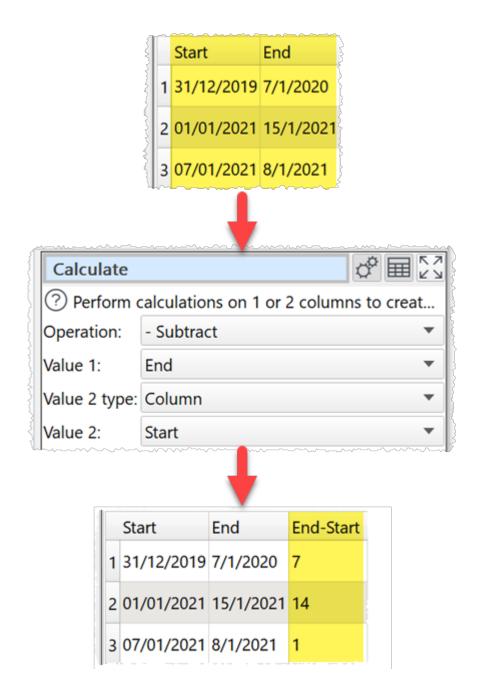

Multiply 2 columns of numeric values:

Add a days column to a date column:

Calculate the difference in days between 2 date columns:

Inputs

One.

Options

- Uncheck **automatic new column name** to set a name for the newly created column in **New column name**.
- Set **Operation** to the operation you wish to perform.
- Set Value 1 to the first column of values you wish to operate on.

- Set **Value 2 type** depending on whether you wish to use a single value or a column of values for the second value (binary operations only).
- Set **Value 2** to the second column of values or constant value you wish to operate on (binary operations only).

Notes

• The following operations are supported.

Operation	Value 1	Value 2	Notes	Examples
+ Add	Number	Number	Numerical addition.	1.2 + 3 = 4.2
	<u>Date</u>	<u>Integer</u> <u>number</u>	Adds days to the date.	31/01/2021 + 7 = 07/02/2021
- Subtract	<u>Number</u>	<u>Number</u>	Numerical subtraction.	1.2 - 3 = -1.8
	<u>Date</u>	<u>Integer</u> number	Subtracts days from the date.	31/01/2021 - 7 = 24/01/2021
	<u>Date</u>	<u>Date</u>	Days the date in Value 1 is after the date in Value 2 (negative if before).	31/01/2021 - 24/01/2021 = 7 24/01/2021 - 31/01/2021 = -7
* Multiply	<u>Number</u>	<u>Number</u>	Numerical multiplication.	1.2 * 3 = 3.6
/ Divide	Number	<u>Number</u>	Numerical division.	1.2 / 3 = 0.4 1 / 0 = Error
^ Power	<u>Number</u>	<u>Number</u>	Value 1 to the power Value 2 (Value 1 ^{Value 2}).	1.2 ^ 3 = 1.728 2 ^ -3 = 0.125
% Modulus	<u>Integer</u> <u>number</u>	<u>Integer</u> number	Remainder after Value 1 is divided by Value 2.	7 % 2 = 1 7 % 0 = Error
Abs	Number	N/A	The absolute value.	Abs(1.2) = 1.2 Abs(-1.2) = 1.2
And	<u>Boolean</u>	<u>Boolean</u>	Logical AND.	And(true, false) = false And(1, 1) = true And(0, FALSE) = false
Ceiling	<u>Number</u>	N/A	The smallest integer that is not less than the value.	Ceiling(1) = 1 Ceiling(1.2) = 2 Ceiling(-1.2) = -1
DateTime ToMSecs	ISO datetim e	<u>Integer</u> <u>number</u>	Convert an ISO datetime to the number of milliseconds since 1970-01- 01:00:00:00.000 UTC .	DateTimeToMSecs(1970-01- 01) = 0 DateTimeToMSecs(2022-09- 15T21:06:10) = 1663272370000 DateTimeToMSecs(1969-12- 30T13:42:23.211Z) = - 123456789 DateTimeToMSecs(2022-09-
				16T13:00:02+01:00) =

- Each row is calculated separately.
- Whether values are interpreted as number, dates or text depends on **Supported date** formats and <u>locale</u>.
- To concatenate text in different columns use the <u>Concat Cols</u> transform.
- To compare 2 columns use the <u>Compare Cols</u> transform.
- For logical operations use the <u>If</u> transform.
- For operations on whole rows or columns use the <u>Stats</u> transform.
- For more complex calculations, including number/date, use the <u>Javascript</u> transform.
- To modify the numerical precision of the results use the Num Format transform.
- To add a new column of values use the <u>New Col</u> transform.

See also:

• Video: How to convert a Unix timestamp

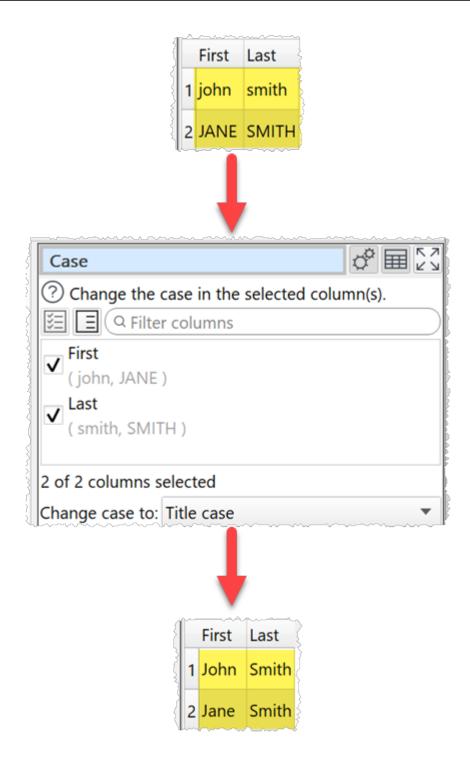

2.3.3 Case

Description

Changes the case of text in one or more columns.

Example

Set names to title case:

Inputs

One.

Options

- Check the column(s) you wish to transform.
- Set Change case to according to the case you want:

Case	Description	Example output for ' WORD word Word !'
Lower case	Converts all letters to lower case.	word word word !
Upper case	Converts all letters to upper case.	WORD WORD WORD !
Title case	Converts the first letter of each word to upper case and all other letters to lower case.	Word Word Word !
Sentence case	Converts the first letter to upper case and all other letters to lower case.	Word word word !
Lower camel case	Converts the first letter for the second and subsequent words to upper case and all other letters to lower case. Removes whitespace.	wordWordWord!
Upper camel case	Converts the first letter of each word to upper case and all other letters to lower case. Removes whitespace.	WordWordWord!
Kebab case	Replaces multiple consecutive whitespace characters with a single - (dash) character.	-WORD-word-Word-!
Snake case	Replaces multiple consecutive whitespace characters with a single _ (underscore) character.	_WORD_word_Word_!
Inverted case	Convert lower case letters to upper case and upper case letters to lower case.	word WORD wORD !

See also

• <u>Whitespace</u>

2.3.4 Chop

Description

Remove characters from the start or end in one or more columns.

Example

Remove leading zeros:

Q Filter co	1 0000001 2 0000002 3 0000003 ber of charae olumns 0002, 000000	cters fro		start o	
Q Filter co	3 0000003	cters fro

Q Filter co	olumns				
Q Filter co	olumns				
Q Filter co	olumns		om the	start o	
0001, 0000	002, 000000				
	,	3)			
olumns sele	ected				
6					
Start					
		1 1	1 1		

One.

Options

- Check the column(s) you wish to transform.
- Set **Length** to the number of characters you want to remove.
- Set **From** to **Start** or **End** depending on whether you want to remove characters from the start or end.

Notes

- If you can to keep the original column use Copy Cols to copy the column first.
- Whitespace is counted when calculating length. You can use <u>Whitespace</u> to remove whitespace before chopping.
- If you want to set a column to a fixed length use <u>Pad</u> and Chop together.

See also

• Extract

2.3.5 Clone

Description

Makes an exact copy of the input dataset.

Inputs

One.

Options

• None.

Notes

• Clone can be useful to simplify complicated layouts.

2.3.6 Cluster

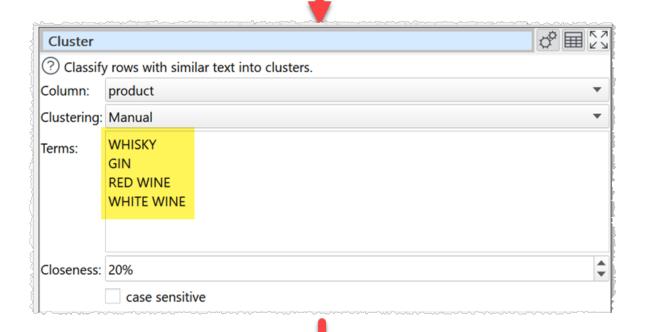

Description

Classify rows with similar text into clusters

Examples

Clustering products by type:

F	product	unit	cost	stock
1 H	French red wine		23.95	9
2 E	BULGARIAN RED WN		11.95	13
3 F	Red Label Whisky		38.45	1
4 0	Gordon's Gin		25	7
5 0	German White Wine		14.95	6
6 I	Larios Gin		19.90	50
7 E	Black Label Whisky		45.50	8
8 1	Nine, White, Dessert		30.00	1
90	Cocoa Cola		1.95	200

~	product	unit cost	stock	Cluster	Closeness
	1 French red wine	23.95	9	RED WINE	53
	2 BULGARIAN RED WN	11.95	13	RED WINE	25
	3 Red Label Whisky	38.45	1	WHISKY	37
	4 Gordon's Gin	25	7	GIN	25
	5 German White Wine	14.95	6	WHITE WINE	58

4	344 George Avenue	Mobile	Alabam	ALABAMA	85
5	2555 Lonely Oak Drive	Mobile	ALABAMA	ALABAMA	100
6	2816 Barrington Court	Pine Bluff		ARKANSAS	87

One.

Options

- Select the **Column** whose values you wish to use for clustering.
- Select Clustering as:
 - o Manual to cluster by Terms you provide (one per line).
 - Guided to find clustering terms automatically, starting with the Terms you provide (one per line).
 - Automatic to find clustering terms automatically.
- Set the minimum **Closeness** percentage for a value to a term to be clustered with a term.
- Set Max clusters to the maximum number of clustering terms (Guided and Automatic only).
- Set **Max time** to the maximum amount of time allowed for trying to improve the terms (**Guided** and **Automatic** only).
- Uncheck **case sensitive** to ignore case.

Notes

- <u>Fuzzy matching</u> is used to classify each row value according to which of the user supplied **Terms** it is closest to.
- Additional **Cluster** and **Closeness** columns are added. The **Cluster** column shows the closest matching of the **Terms** (or the one highest one in the **Terms** list if 2 or more match equally). The **Closeness** column shows the fuzzy match score between 0 (no match) and 100 (exact match).
- Row values that do not meet the minimum **Closeness** score for any term are set to <None>.
- Set the minimum Closeness score to 0% to force all values to be assigned.
- You can use a <u>Filter</u> to list all the rows with <None> in the **Cluster** column to guide you on any additional **Terms** you might want to add in **Manual** mode.

See also:

- <u>Ngram</u>
- Video: How to cluster text

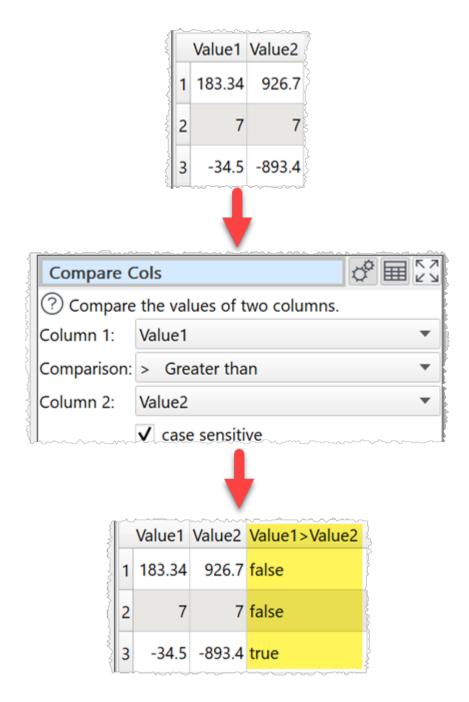

2.3.7 Compare Cols

Description

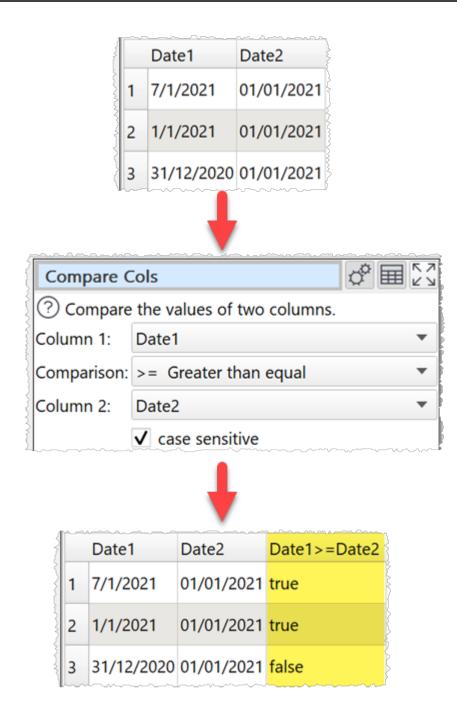

Creates a new column with a comparison of two other columns.

Examples

Compare 2 numerical columns:

Compare 2 date columns:

One.

Options

- Uncheck **automatic new column name** to set a name for the newly created column in **New column name**.
- Select the two columns you wish to compare as **Column 1** and **Column 2** and the **Comparison** operator.

• Check case sensitive to use case sensitive matching for text.

Notes

- <u>Number</u>, <u>date</u> and <u>text</u> values are treated differently for **Equal to**, **Greater than**, **Less than**, **Greater than equal**, **Less than equal** and **Not equal to** operations.
 - If both values are numeric, a numeric comparison will be carried out. This is accurate to approximately 16 digits of precision.
 - If both values match a supported date formats in <u>Preferences</u>, a date comparison will be carried out.
 - o Otherwise the values will be treated as text.
 - For example, an empty value is considered less than 0, because they will be compared as text. So you might want to <u>replace empty values with 0</u> or remove those rows with <u>Filter</u>, before comparing them.
- Comparisons of text are whitespace sensitive. You can use <u>Whitespace</u> to remove whitespace before filtering and <u>Replace</u> to get of other unwanted characters (e.g. whitespace inside the text).
- The new column is added at the right end. You can change the column order with <u>Reorder</u> <u>Cols</u> and the column name with <u>Rename Cols</u>.
- See here for more details on <u>Regular expressions</u> (regex).

See also

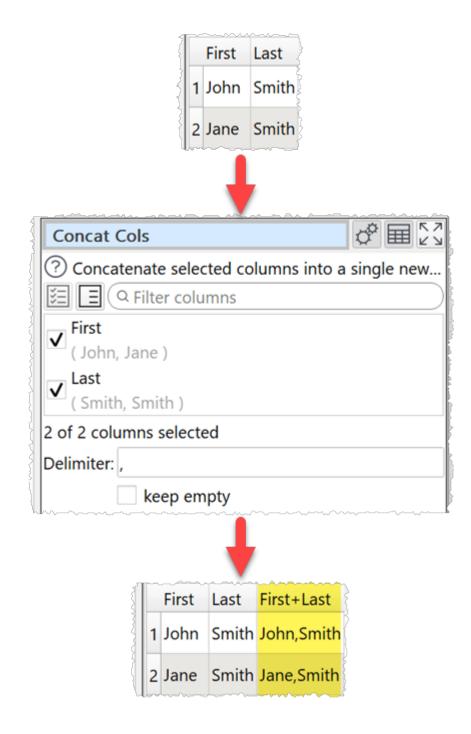

- Split Cols
- 2.3.8 Concat Cols

Description

Creates a new column by concatenating text from existing columns.

Example

Concatenate 'First' and 'Last' columns with a comma between:

One.

Options

- Uncheck **automatic new column name** to set a name for the newly created column in **New column name**.
- Check the columns you wish to concatenate.

- Supply the **Delimiter** you wish to place between concatenated text (optional). For example ",".
- Check keep empty if you wish to keep the delimiter for empty columns.

Notes

- If there is a header, the header of the new column is formed from the header of the concatenated columns. You can use <u>Rename Cols</u> to change the new column name.
- Concatenating a single column makes a copy of the column.
- The values in the column are in the order of the original columns. You can change the column order before concatenation with <u>Reorder Cols</u>.
- The new column is added at the right end. You can change the column order with <u>Reorder</u> <u>Cols</u> and the column name with <u>Rename Cols</u>.
- The opposite of **Concat Cols** is <u>Split Col</u>.

See also

- <u>Concat Rows</u>
- <u>Substitute</u>

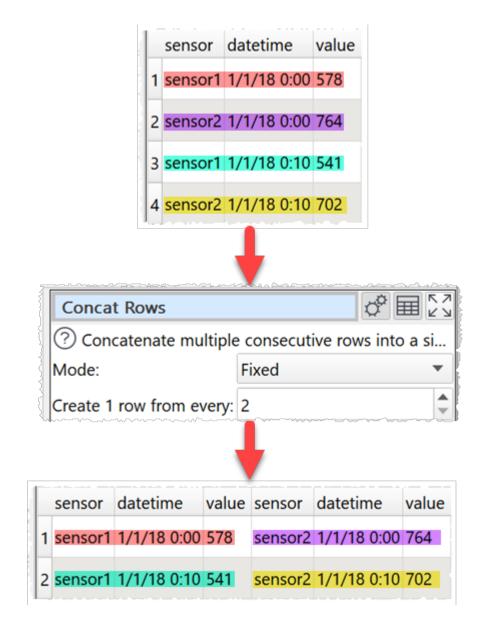

2.3.9 Concat Rows

Description

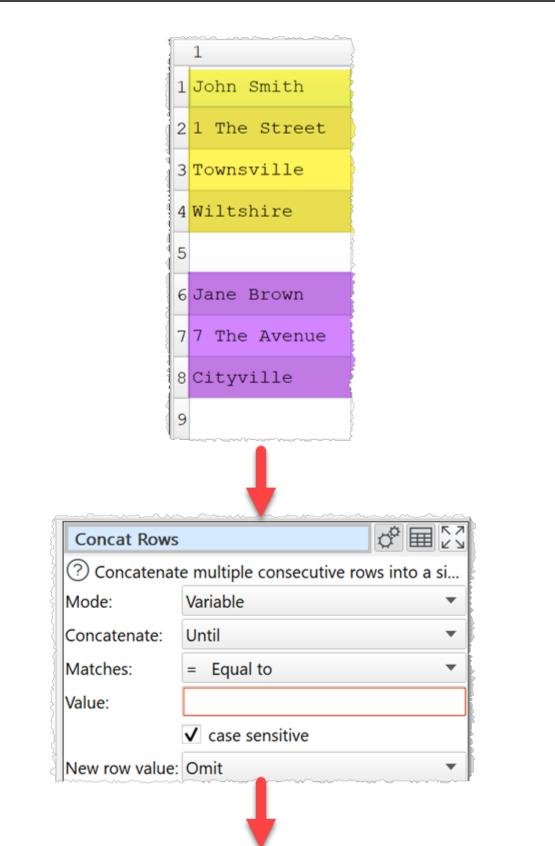

Concatenate multiple consecutive rows into a single row.

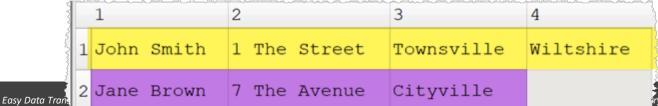

Examples

Concatenate every 2 rows to 1:

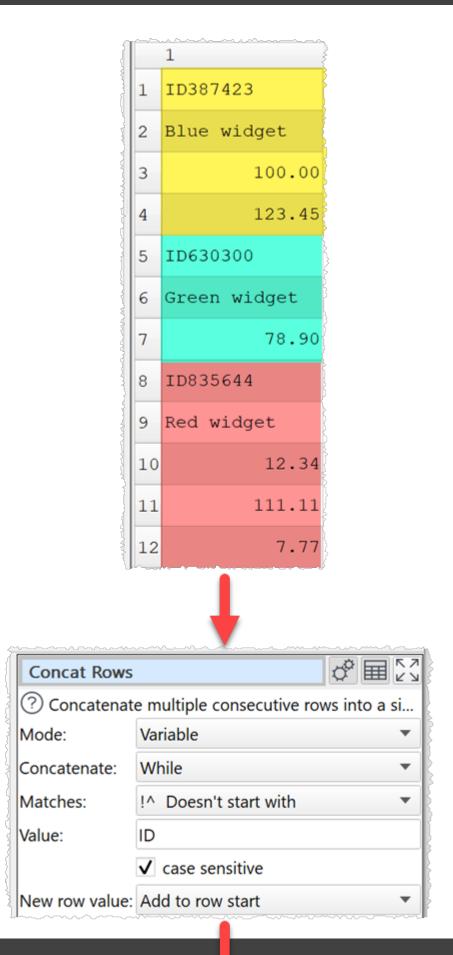

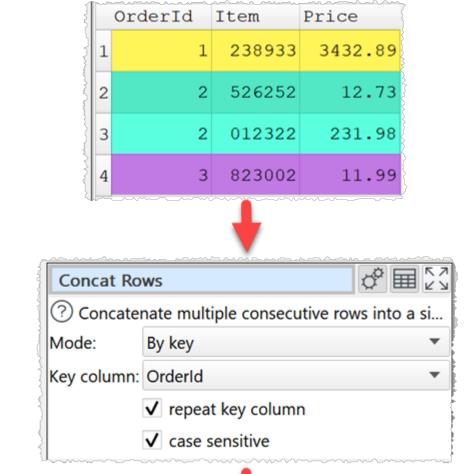

Concatenate values until empty:

Concatenate values while not starting with 'ID':

Concatenate consecutive rows with the same OrderId:

ſ		OrderId	Item	Price	OrderId	Item	Price
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~	1	1	238933	3432.89			
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~	2	2	526252	12.73	2	012322	231.98
	3	3					

Inputs

One.

Options

- Set Mode to:
 - **Fixed** to concatenate a fixed number of rows from the current dataset to make each new row.
 - Variable to concatenate values while or until a match to make each new row.
 - **By key** to concatenate consecutive rows with the same value in a key column to make each new row.
- Set **Create 1 row from every** to N, to concatenate every N rows into 1 row (**Mode=Fixed** only).
- Set **Concatenate** to **Until** or **While** to keep concatenating until/while a match is found for **Matches** and **Value** (**Mode=Variable** only).
- Check **case sensitive** to use case sensitive matching for text (**Mode=Variable** or **By Key** only).
- Set **New row value** depending on what you want to do with the value that denotes a new row (**Mode=Variable** only).
- Uncheck repeat key column to keep only the first key column (Mode=By Key only).

Notes

- Use <u>Sort</u> before this transform if you need to change the row order.
- Use <u>New Col</u> if you need to add additional columns before concatenating rows.
- Use <u>Filter</u> if you need to remove rows before concatenating row.
- Use <u>Rename Cols</u> if you need to change column names after concatenating rows.
- The opposite of **Concat Rows** is <u>Split Rows</u>.

See also

- <u>Spread</u>
- <u>Unique</u>
- <u>Concat Cols</u>

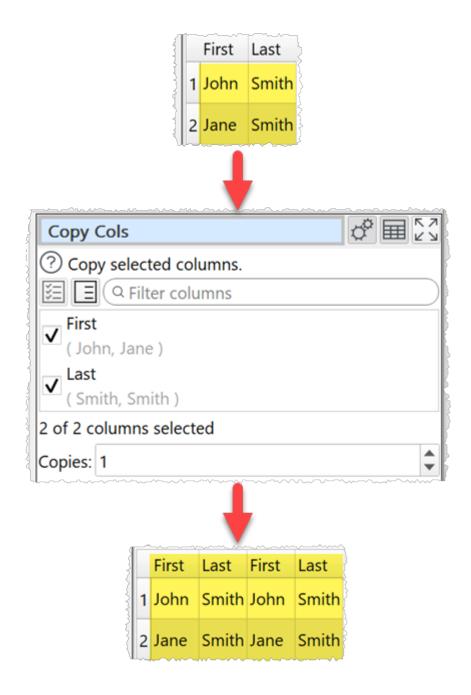

2.3.10 Copy Cols

Description

Creates one or more copies of the selected column(s).

Example

Copy 2 columns, once each:

One.

Options

- Check the columns you wish to copy.
- Set **Copies** to the number of copies you want to make of each checked column.

Notes

- If there is a header, the header of each new column is the original column name. You can rename columns with <u>Rename Cols</u>.
- The new columns are added at the right end. You can change the column order with <u>Reorder Cols</u>.

See also

- <u>New Col</u>
- 2.3.11 Correlate

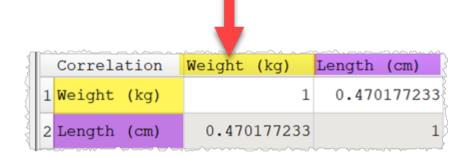

Description

Calculates the Pearson correlation coefficient of values in 2 or more pairs of columns.

Example

Calculate the correlation between specimen weight and length:

		Weight (kg)	Length (c	m)			
	1	3.63		53.1			
	2	3.02		49.7			
	3	3.82		48.4			
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~	4	3.42		54.2			
	5	3.59		54.9			
	6	2.87		43.7			
	7	3.03		47.2			
	8	3.46		45.2			
	9	3.36		54.4			
	10	3.3		50.4			
	,						
Correla	ate			° d	) 🗏 🖓		
? Calc	⑦ Calculate the correlation of 2 or more pairs of columns.						
E Q Filter columns							
✓ Weight (kg) ( 3.63, 3.02, 3.82, )							
✓ Leng ( 53.	✓ Length (cm) (53.1, 49.7, 48.4,)						
2 of 2 co	olum	ns selected					

One.

## Options

• Select 2 or more **Columns** whose values you wish to calculate the correlation for. All possible pairs of selected columns will be calculated.

#### Notes

- The <u>Pearson correlation coefficient</u> is calculated in the range +1.0 to -1.0 where:
  - o +1.0 means a perfect correlation
  - $\circ$  0.0 means no correlation
  - o -1.0 means a perfect inverse correlation
- A column is assumed to always perfectly correlate with itself. Even if it has no numeric values.
- Pairs of values are ignored if they are not both valid <u>numeric</u> values.
- N/A is returned if two columns have no valid numeric pairs.
- N/A is returned if all the numeric values in a column are identical (as this gives a standard deviation of 0, which causes a divide by 0 error).
- Use the Num Format transform to change the number of decimal places .

## See also

- <u>Video: How to calculate Pearson correlation</u>
- <u>Stats</u>
- <u>Summary</u>

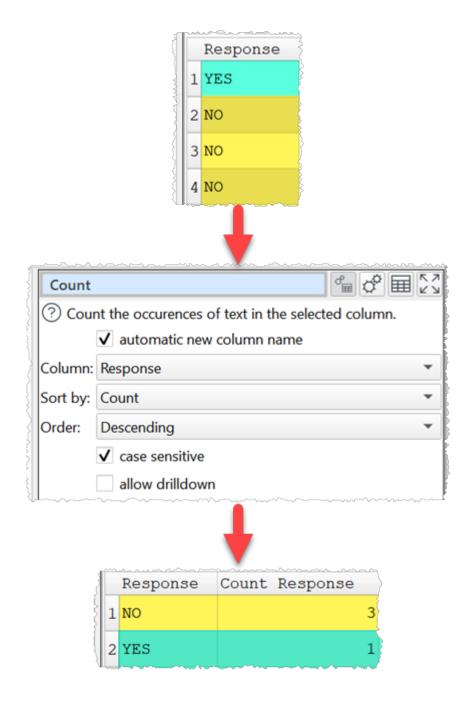

#### 2.3.12 Count

#### Description

Counts the number of occurrences of each item of text in the selected column.

## Example

Count unique values in the 'Response' column:

One.

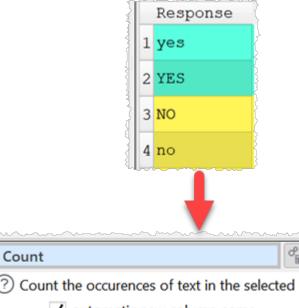

## **Options**

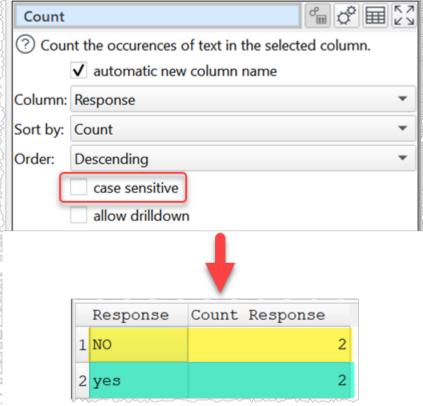

- Uncheck **automatic new column name** to set a name for the newly created column in **New column name**.
- Select the **Column** whose values you wish to count.
- Set **Sort by** depending on whether you wish to sort alphabetically by the **Text** in the left column or numerically by the **Count** in the right column.

- Set Order depending on whether you wish to sort Ascending or Descending.
- Uncheck **case sensitive** to convert everything to lower case before counting.
- Check **drilldown** to allow double clicking a row in the data table to <u>drilldown</u> to the rows that contributed to this value in the upstream data.

## Notes

- Date and number values are treated as text.
- Use <u>Rename Cols</u> to change the new column name.
- Use <u>Scale</u> to convert the results to percentages.
- If **case sensitive** is unchecked, the case of the first value encountered is used. You can use a <u>Sort</u> or <u>Case</u> transform before **Count** if you want to control the case shown.

## See also

- <u>Ngram</u>
- <u>Unique</u>
- <u>Total</u>
- Moving
- <u>Pivot</u>
- Stats
- <u>Summary</u>

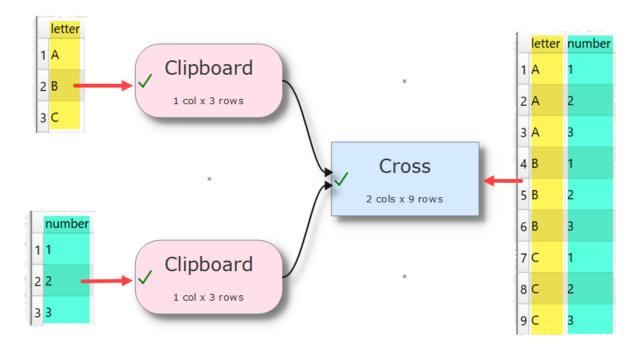

#### 2.3.13 Cross

## Description

Creates an output from combining every possible row combination of each input. E.g. if the first input has N1 rows and the second input has N2 rows, then the result will have N1 X N2 rows. Also known as a 'Cartesian product' or 'cross join'.

## Example

Cross 2 small datasets:

## Inputs

Two or more.

## **Options**

• The output depends on the vertical (Y-axis) position of the inputs.

#### **Notes**

• It can create a very large number of rows!

## See also

- <u>Join</u>
- Stack

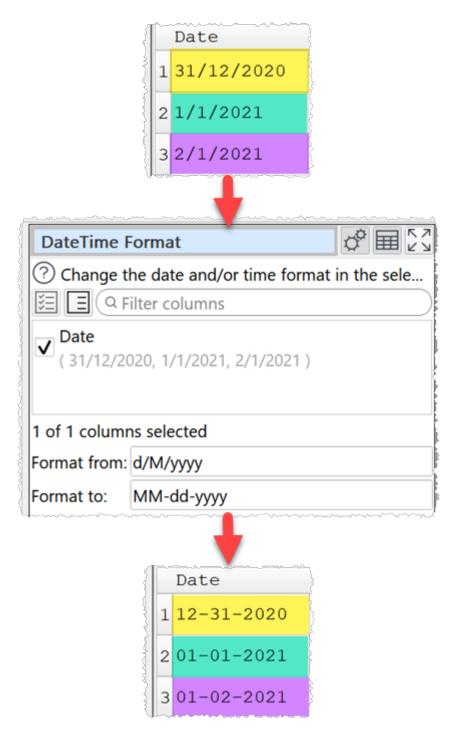

#### 2.3.14 DateTime Format

#### Description

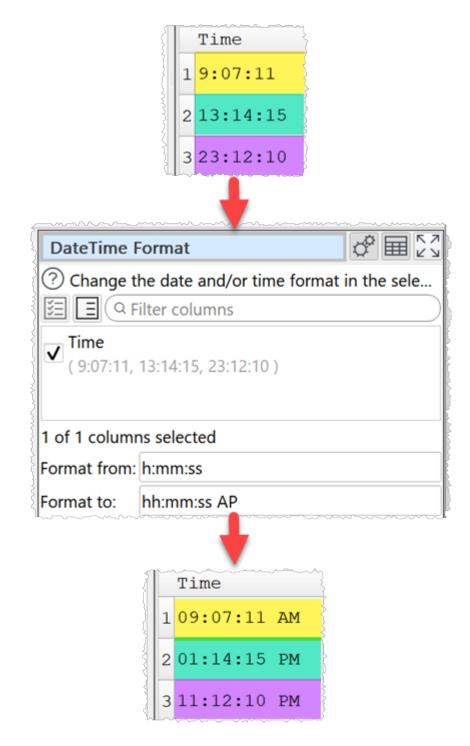

Changes the date and/or time format in one or more columns.

#### **Examples**

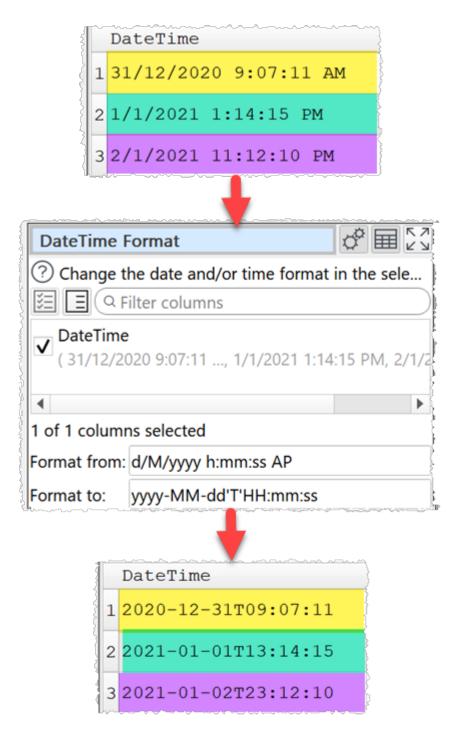

Change day/month/year to month-day-year:

Change 24 hour time to AM/PM time:

Change datetime to ISO format:

Example formats for 21 May 2001 14:13:09.120 with locale set to English/United States:

Format to	Output
dd.MM.yyyy	21.05.2001
уууу-д-М	2001-21-5
ddd MMMM d yy	Mon May 21 01
hh:mm:ss.zzz	14:13:09.120
hh:mm:ss.z	14:13:09.12
hhmmss	141309
h:m:s ap	2:13:9 pm
yyyy-MM-dd'T'HH:mm:ss.zzz	2001-05-21T14:13:09.120
HH:mm:ss 'in yyyy-MM-dd HH:mm:ss format'	14:13:09 in HH:mm:ss format

One.

# Options

- Check the columns you wish to transform.
- Supply the existing date and/or time format in Format from (see below).
- Supply the new date and/or time format in Format to (see below).
- Use Non-date to set what to do for values that don't match Format from.
- Use With value for values that don't match Format from when Non-date is set to Change to user defined.
- The following date and/or time formats are supported for input and output:

Relates to		Format	Meaning
Date	Years	УУ	The year as a two digit number (00 to 99).
		УУУУ	The year as a four digit number. If the year is negative, a minus sign is prepended in addition.
	Months	М	The month as number without a leading zero (1 to 12).
		MM	The month as number with a leading zero (01 to 12)
		МММ	The abbreviated localized month name (e.g. 'Jan' to 'Dec'). Uses the <u>locale</u> to localize the name.
		MMMM	The long localized month name (e.g. 'January' to 'December'). Uses the <u>locale</u> to localize the name.
	Days	d	The day as number without a leading zero (1 to 31).
		dd	The day as number with a leading zero (01 to 31).
		ddd	The abbreviated localized day name (e.g. 'Mon' to 'Sun').
nsform			Uses the locale to localize the name.

Value	Default
Year	1900
Month	1
Day	1
Hour	0
Minute	0
Second	0
Milliseconds	0

If not set, the default values are:

#### Notes

- An exact match is expected for the input date. E.g. Format from is yyyy-MM-dd then 2020-12-17 will be converted, but 2020-12-17T14:58 won't. You can extract just the date or time part here using <u>Split Col</u> with T as the delimiter.
- Use the correct case for the format text (e.g. yyyy-MM-dd, <u>not</u> YYYY-mm-DD).
- The locale is used to decide how the date is represented (e.g. names of months and days).
- Any non-empty sequence of characters enclosed in single quotes will be included verbatim in the output (stripped of the quotes), even if it contains formatting characters. Two consecutive single quotes ('') are replaced by a single quote in the output. All other characters in the format text are included verbatim in the output.
- Formats without separators (e.g. ddMM) are supported but must be used with care, as the resulting output isn't always reliably readable (e.g. if dM produces 212 it could mean either the 2nd of December or the 21st of February).
- You can also use <u>Split Col</u> to split a date into its component parts. For example to split "31/1/2019" into day, month and year components using the "/" delimiter.
- If the date to be converted has only two year digits, it is treated as a date between 1900 and 1999. E.g. "31/1/19" is interpreted in d-M-yy format as 31st January <u>1919</u>. You can avoid that issue by explicitly setting the century, e.g.:

Format from:	MM/dd/yy
Format to:	MM/dd/20yy

Or you can use <u>Replace</u>. For example to replace 01/15/18 with 01/15/2018:

Match Type	Replace	With
1 Regex 🔻	(\d\d)/(\d\d)/(\d\d)	\1/\2/20\3

- Some dates do not exist, so cannot be converted. For example, 29-02-2023 matches the format dd-MM-yyyy. However the date does not exist, so won't be converted.
- Some datetimes do not exist, so cannot be converted. For example, if your **Locale** is **Spanish / Chile** then 03-09-2023 0:00:00 may not be converted with **Format from** dd-MM-yyyy H:mm:ss, as in Chile the clock is changed at 24:00 first Saturday of September, so 0:00 of next Sunday doesn't exist. This can also depend on the time zone set in your operating system.
- Warnings are shown in the **Warnings** tab for values that don't match **Format from** or don't correspond to a real date or datetime.
- You can also do date and time format conversion using the <u>Javascript</u> transform.

## See also

<u>Num Format</u>

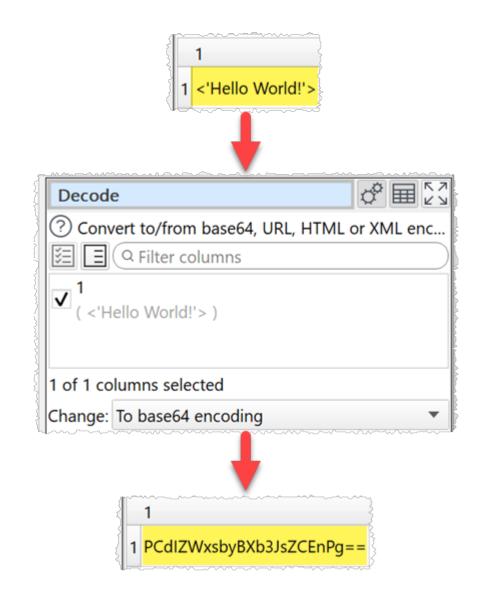

#### 2.3.15 Decode

#### Description

Convert to/from Base64 encoding, URL encoding, escaped HTML or escaped XML.

## Example

Convert <'Hello World!'> to base64 encoding:

Туре	Plaintext	Encoded
Based64 encoding	<'Hello World!'>	PCdIZWxsbyBXb3JsZCEnP g==
URL encoding	<'Hello World!'>	%3C%27Hello%20World% 21%27%3E
HTML escaping	<'Hello World!'>	<'Hello World!'>
XML escaping	<'Hello World!'>	<'Hello World!'>

One.

# Options

- Check the column(s) you wish to transform.
- Set Change according to how you want to decode/encode the selected columns.

## Notes

- This is distinct from text encoding (e.g. UTF-8 vs UTF-16) which is handled on <u>input</u> and <u>output</u>.
- Use <u>Copy Cols</u> to copy columns before you transform them.
- Data input from <u>XML</u> files and output to <u>HTML</u> and <u>XML</u> files is unescaped/escaped automatically.

#### 2.3.16 Dedupe

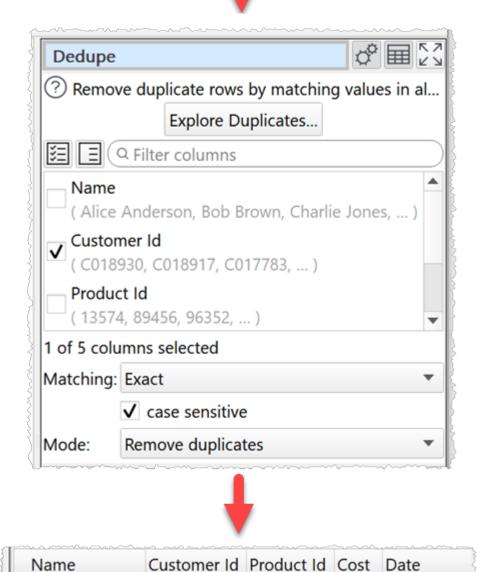

## Description

Remove duplicate rows.

## Example

Keep the first row for each unique 'Customer Id':

	Name	Customer Id	Product Id	Cost	Date
1	Alice Anderson	C018930	13574	29.95	01/10/2020
2	Bob Brown	C018917	89456	10.55	01/10/2020
3	Charlie Jones	C017783	96352	19.95	02/10/2020
4	Robert Brown	C018917	98526	10.00	02/10/2020
5	Charles Jones	C017783	38746	25.00	03/10/2020

1 Alice Anderson C018930

C019017

2 Rob Brown

© 2024 Oryx Digital Ltd

13574 29.95 01/10/2020

89456 10 55 01/10/2020

One.

## **Options**

- Click **Explore Duplicates...** to explore which rows are duplicates.
- Check the column(s) you wish to look for duplicate values in.
- Set **Matching** to **Exact** to use exact matching to find duplicates and **Fuzzy** to match with some differences. <u>Fuzzy matching</u> is much slower.
- Set **Closeness** to how close a fuzzy match has to be to be considered a match. E.g. set it to 80% to make 2 values that are 80% the same a match. For **Fuzzy** matching only.
- Check case sensitive to use case sensitive matching.
- Check **ignore whitespace** to ignore whitespace characters when matching.
- Check ignore punctuation to ignore punctuation characters when matching.
- Set Mode according to what you want to do with duplicates.
  - o Remove duplicates removes all duplicate rows.
  - Keep only duplicates keeps only the duplicate rows (the inverse of Remove duplicates).
  - Add duplicate information adds extra columns with information about duplicate rows at the end. Reorders rows, but does not remove them. The additional columns are:
    - Group: Each row and its duplicates are given a unique group number, starting at 1.
    - **Row**: The number of the row in the input dataset.
    - **Closeness**: How close a match the duplicate is as a percentage. 100% = exact match.
    - **Duplicate**: Set to true if the row is a duplicate and false if not.
    - Duplicates: Set to the number of duplicates a non-duplicate has.
- Check drilldown to allow double clicking a row in the data table to <u>drilldown</u> to this row and it's duplicates in the upstream data. This is only available when Matching is set to Exact and Mode is set to Remove duplicates.

#### Notes

- Rows are considered duplicates if they match in <u>all</u> the checked columns.
- Comparisons are whitespace sensitive. You can use <u>Whitespace</u> to remove whitespace before deduping and <u>Replace</u> to get of other unwanted characters (e.g. whitespace inside the text).
- When several rows are duplicates, only the top one is retained. So you may want to <u>Sort</u> your dataset first.
- The <u>Unique</u> transform is a more powerful (but more complex and slower) alternative to Dedupe.

## See also

• <u>Dedupe a dataset</u>

# Reference

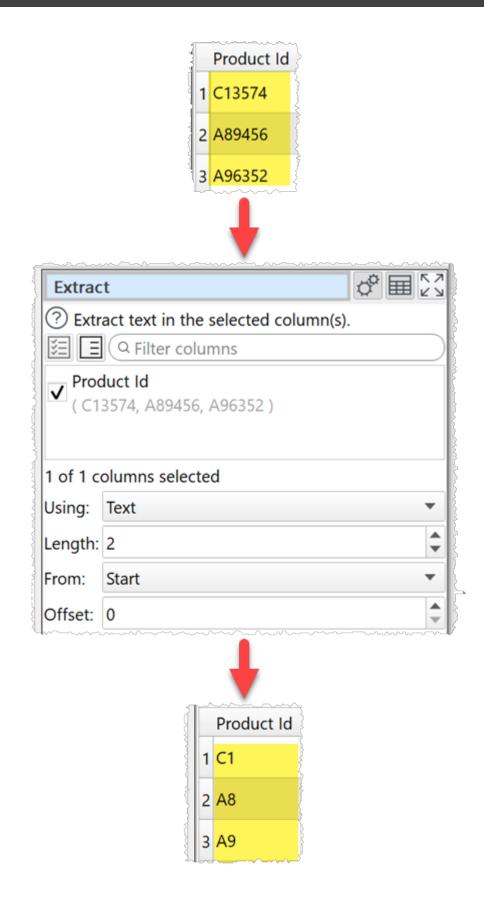

## 2.3.17 Extract

# Description

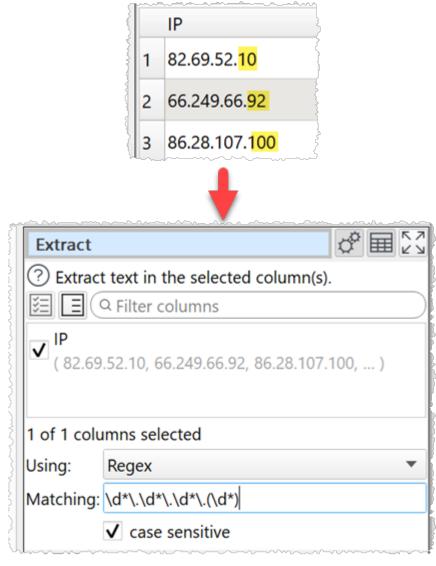

Extract text in one or more columns.

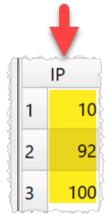

# **Examples**

Extract the first 2 digits from the 'Product Id' column:

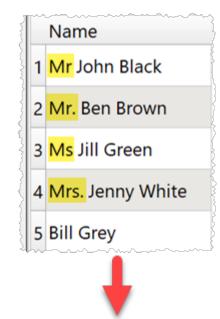

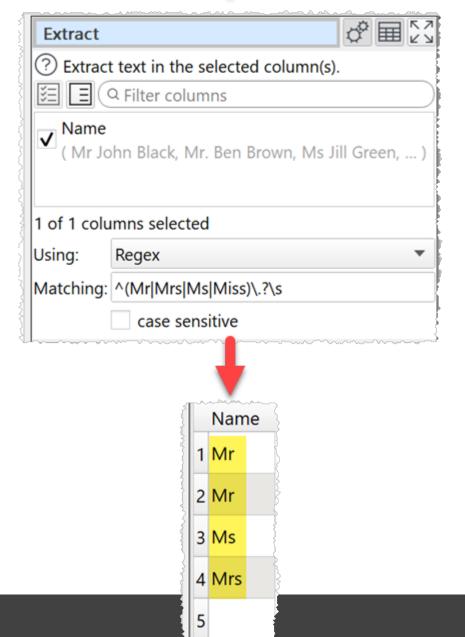

Extract the last group of digits from an IP address:

Extract titles from a name:

One.

## **Options**

- Check the column(s) you wish to transform.
- Set **Using** depending on whether you want to extract a fixed length of text or with a <u>regular</u> <u>expression</u>.
- Set **Length** to the length you want values in selected columns shortened to. **Text** match only.
- Set **From** to **Start** or **End** depending on whether you want to take from the start or end. **Text** match only.
- If **From** is **Start** then **Offset** is the offset of the first character from the start (0 to start with the first character). If **From** is **End** then **Offset** is the offset of the last character from the end (0 to start with the last character). **Text** match only.
- Set **Matching** to a regular expression. **Regex** match only. If the expression contains capture parentheses the first capture will be extracted. Otherwise it will try to capture the whole regular expression. For example:

Value	Regular expression	Extracted
12.34.567.89	$(d^{*}) . d^{*} . d^{*} . d^{*}$	12
12.34.567.89	d*d*d*(d*)	89
12.34.567.89	\d*\.\d*	12.34
ip 12.34.567.89	$d*\.\d*$ .	12.34.567.89
ip 12.34.567.89	^\d*\.\d*\.\d*\.\d*\$	

• Check case sensitive to use case sensitive matching. Regex match only.

#### Notes

- If you can to keep the original column use Copy Cols to copy the column first.
- Whitespace is counted when calculating length. You can use <u>Whitespace</u> to remove whitespace before extracting.
- If you want to set a column to a fixed length use Pad and Extract together.
- Use <u>Replace</u> If you want to extract multiple captures from a value using a regular expression.

# See also

• Chop

# Reference

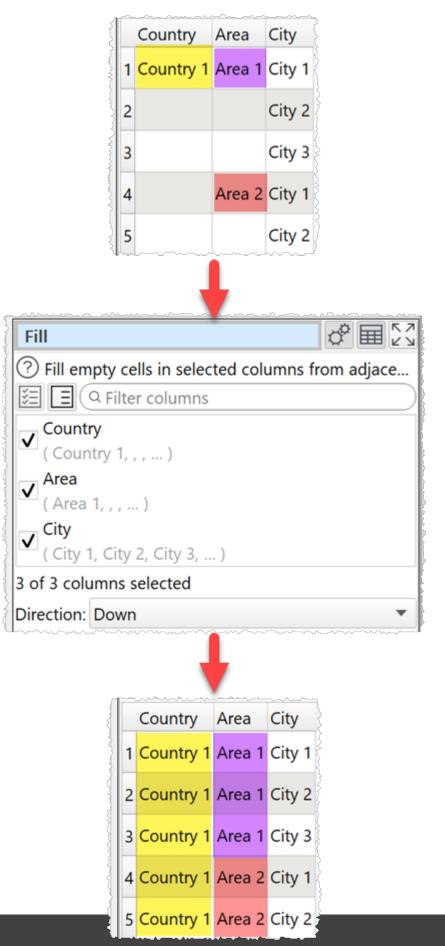

#### 2.3.18 Fill

# Description

Fill empty cells in selected columns with the adjacent non-empty values.

# Example

Fill down:

Easy Data Transform

One.

# Options

- Check the column(s) you wish to fill.
- Select **Direction** depending on the direction you wish to fill to.

## Notes

- Cells containing whitespace are not considered empty.
- To fill empty values with something else use the **Replace** transform.

## See also

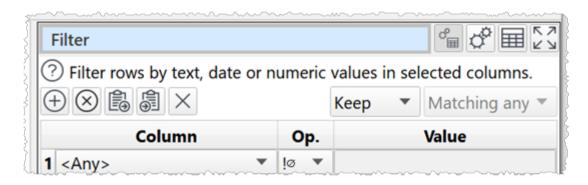

- <u>Unfill</u>
- <u>Slide</u>
- Whitespace
- Impute
- 2.3.19 Filter

## Description

Removes rows based on number, date and text values in selected columns.

## **Examples**

Keep rows with at least 1 non-empty value.

Keep only rows where the 'Tax' value is greater than 0 and the 'Country' value is 'US'.

F	ilter					₫ 🖬 🔀
?	Filter rows by tex	t, c	late	or r	ume	eric values in sel
9			Kee	р	•	Matching all
	Column		0	p.		Value
1	Тах	۳	>	•	0	
2	Country	Ŧ	=	Ŧ	US	

Remove rows where the 'Transaction' value is greater than the 'Threshold' value (using a <u>column variable</u>).

Filter		° 🖉 🗐 🖸		
<ul> <li>? Filter rows by text, date</li> <li>⊕ ⊗ ⊕ ⊕ ×</li> </ul>	Filter rows by text, date or numeric values in selected         Image: Selected selected selected         Image: Selected selected selected         Image: Selected selected selected selected         Image: Selected selected selected selected         Image: Selected			
Column	Op.	Value		
1 Transaction	> •	\$(Threshold)		

## Inputs

One.

# Options

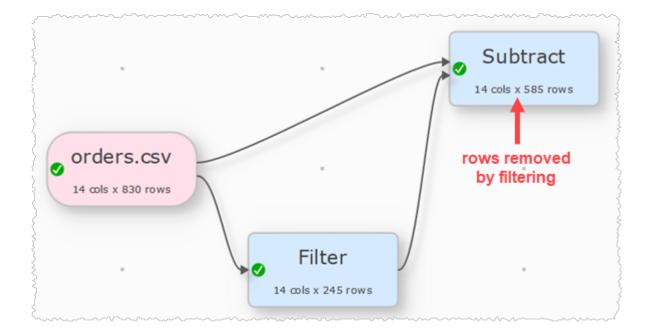

- Click the  $\oplus$  button to add a new filter criteria.
- Click the  $\otimes$  button to delete the selected filter criteria.
- Click the 🗟 button to copy terms to the clipboard.
- Click the  $\widehat{\boxtimes}$  button to paste terms from the clipboard.
- Click the imes button to clear all terms.
- Select Keep if you want to keep matching rows and Remove to remove matching rows.
- Select **Matching all** to match on <u>all</u> criteria (e.g. criteria 1 <u>and</u> criteria 2). Select **Matching any** to require a match on one or more criteria (e.g. criteria 1 <u>or</u> criteria 2).
- Set **Column** to the column you wish to match.
- Set **Op.** to the comparison operator.
- Set **Value** to the value you wish to compare. You can use a <u>column variable</u>.
- Check case sensitive to use case sensitive matching for text.
- Check **disable filtering** to turn off filtering. If sampling is disabled, the transform does nothing.

## Notes

• A text summary of the filters is shown:

Column		Op.		Value
1 Country	•	= 🔻	UK	
2 Units Sold	•	>= 🔻	5	
3 Unit Cost	•	>= 💌	10	

- A filter row is ignored if the Value column is empty , except when **Op.** is **Equal to**, **Not** equal to, Matches regex or **Doesn't match regex**.
- <u>Number</u>, <u>date</u> and <u>text</u> values are treated differently for **Equal to**, **Greater than**, **Less than**, **Greater than equal**, **Less than equal** and **Not equal to** operations.
  - If both values are numeric, a numeric comparison will be carried out. This is accurate to approximately 16 digits of precision.
  - If both values match a supported date formats in <u>Preferences</u>, a date comparison will be carried out.
  - o Otherwise the values will be treated as text.
  - For example, an empty value is considered less than 0, because they will be compared as text. So you might want to <u>replace empty values with 0</u> or remove those rows with <u>Filter</u>, before comparing them.
- All values are treated as text for **Contains**, **Starts with**, **Ends with**, **Matches regex**, **Is not**, **Doesn't start with**, **Doesn't end with** and **Doesn't match regex** operations.
- Comparisons of text are whitespace sensitive. Cells with whitespace will not match Is
  empty. You can use <u>Whitespace</u> to remove whitespace before filtering and <u>Replace</u> to get
  of other unwanted characters (e.g. whitespace inside the text).
- See here for more details on <u>Regular expressions</u> (regex).
- Y can use <u>Subtract</u> to see rows removed by filtering if there is unique key column.

- If you are pasting in filter terms, the format expected is comma delimited text with 3 columns.
  - $_{\odot}$  The first column is the 0-based index of the Column drop-down list.
  - o The second column is the 0-based index of the **Op.** drop-down list.
  - The third column is the Value.

For example, pasting in:

0,0,YES

Will add:

Column	Op.	Value	
1 <any> 🔻</any>	c 🔻	YES	

You can also try copying terms to the clipboard and pasting into a text file to see the format. If you only paste in 1 column of text, it will be assumed to be a list of **Value**. You can, of course, use Easy Data Transform to create the appropriate filter terms and paste them into memory.

## See also

- <u>Compare Cols</u>
- <u>Slice</u>

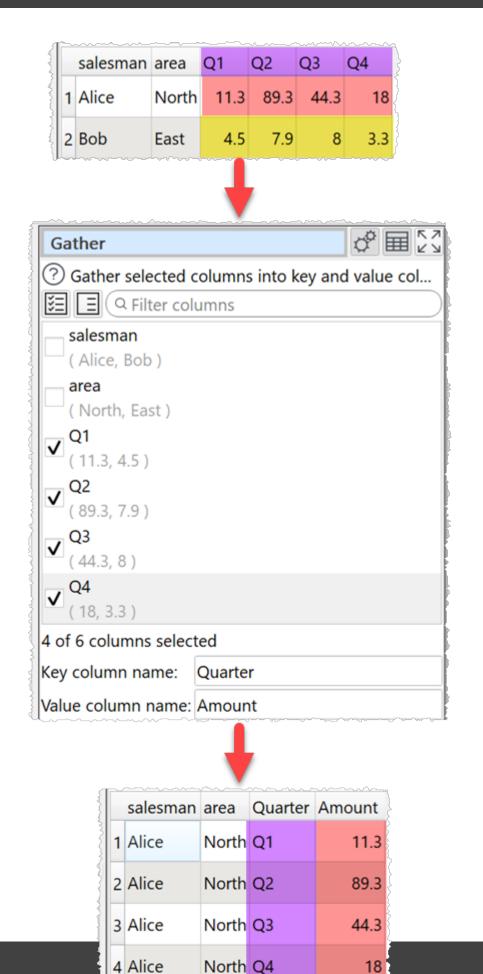

## 2.3.20 Gather

## Description

Gather multiple columns into new key and value columns. Also called unpivot, long pivot or group by.

# Example

Gather 'Q1', 'Q2', 'Q3' and 'Q4' columns into 1 column.

One.

## **Options**

- Select the **Columns** you wish to gather.
- Set **Key column name** to the name of the new key column, which will have values based on the names of the columns selected.
- Set **Value column name** to the name of the new value column, which will have values based on the values in the columns selected.

## Notes

- New columns are added at the right end. You can change the column order with <u>Reorder</u> <u>Cols</u>.
- You can merge the value and key columns into a single column with Concat Cols.
- The opposite of Gather is <u>Spread</u>.

## See also

- Video: How to unpivot Excel
- Split Rows

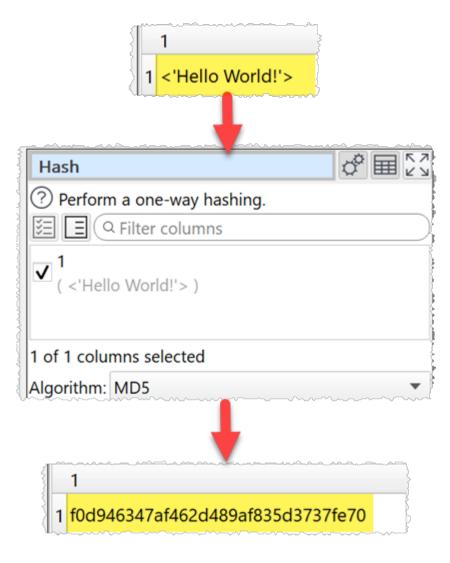

#### 2.3.21 Hash

## Description

Perform one-way hashing on selected columns.

#### Example

Compute the MD5 hash of <'Hello World!'>:

Туре	Plaintext	Secret	Hashed
SHA1	<'Hello World!'>		4a700d8555aae49 7cc54d32f6f3d74 78200a5dea
SHA-256	<'Hello World!'>		2c6139a5d874b96 26e3ae2443fa85c dfe1fc18f148034 8267f8bf71a783f 738a
SHA-512	<'Hello World!'>		23728b865af0f17 bb9bfaaf064f711 bf00626c07e5389 dcbb18365ace19c 2394d7a00066c0b 6a7112dab528e62 106a855dd6bc41d 0c262fb72e9f47e 10f1652c
SHA3-256	<'Hello World!'>		0701263723cdbdf 11e1f7118e62d7d 29d61f01f8490ef 775e4991558634b d719
SHA3-512	<'Hello World!'>		61cbf6f11e864af 592626d9430271a 5ad6f39edf7e097 19a97c57b5c3222 cdf24bd70f1f692 7b7b41eb948bbdd fe0a4ae965688a4 a6882df7be36492 ad653ab0
Keccak-256	<'Hello World!'>		1a45dd8df9de650 49692d9192509b3 0560b69c1fd881c 57b2cf4607e85b3 569f
Keccak-512	<'Hello World!'>		2741b7ddfe0d4c4 726d476cc719fdb b3b7db88fe6df1a 1df00723547c546 496ac49bd82e940 09f4572d3a31fe0 fc50bce1ee3c76d 983f8ddc480b7da 9cd1ed02
MD5	<'Hello World!'>		f0d946347af462d 489af835d3737fe 70
HMAC-MD5	<'Hello World!'>	ABC123	5940ca9b5f2b47a e1972ab81db [@] 2020

One.

## **Options**

- Check the column(s) you wish to transform.
- Set Algorithm to the hashing algorithm you wish to use
- Set **Secret** to the secret key you wish to use (HMAC-MD5 only). The default value is randomly generated.

#### Notes

- There is no known way to reverse these hashes.
- As the chance of 2 different inputs generating the same hash value by chance (a 'collision') is infinitesimally small, hashing can be used to anonymize data or to help find duplicates of long data values.
- The MD5 algorithm is now considered weak as a cryptographic hash. But remains suitable for other non-cryptographic purposes.
- Use <u>Copy Cols</u> to copy columns before you transform them.

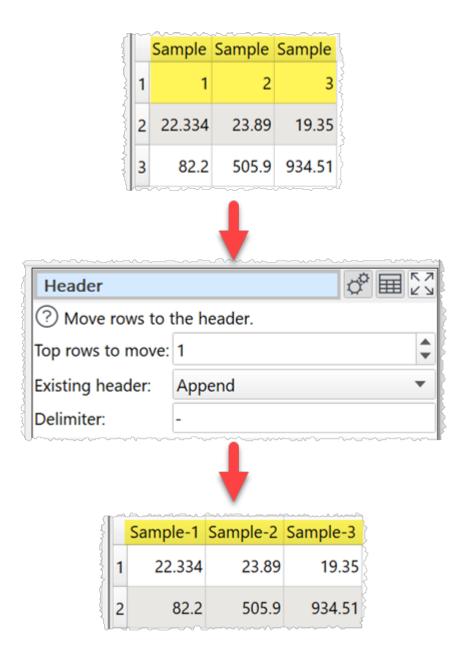

#### 2.3.22 Header

## Description

Move rows from the top of the dataset into the header.

#### Example

Append the first row to the header:

One.

# Options

- Set **Top rows to move** to the number of rows you want to move from the top dataset into the header. Setting it to 0 means the transform does nothing.
- Set **Existing header** to **Overwrite** to ignore the existing header values and **Append** to add to the existing header values.
- Set **Delimiter** to any text you want to put between column elements. It can be left empty. Ignored if **Existing header** set to **Overwrite** and **Top rows to move** set to **1**.

## Notes

- Empty cells are ignored.
- You can <u>Sort</u> and <u>Filter</u> your dataset to change the top rows.
- You can add the header from one dataset to another dataset using <u>Stack</u>.

# See also

• <u>Headers</u>

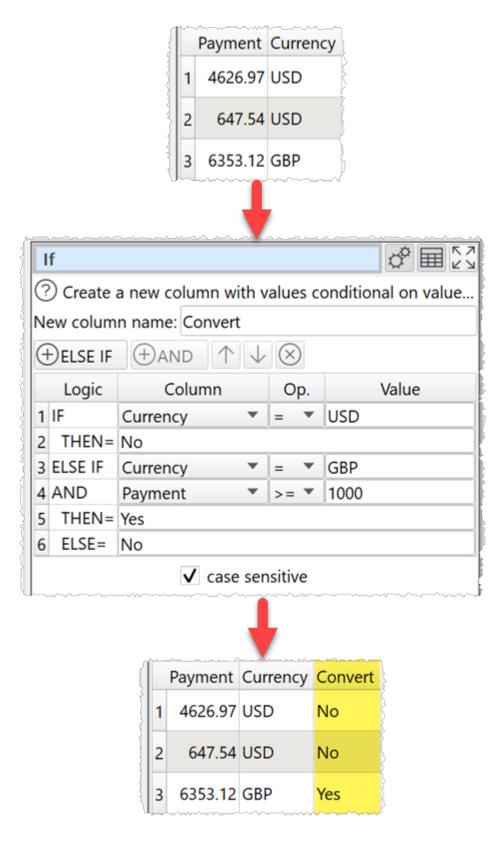

## 2.3.23 If

## Description

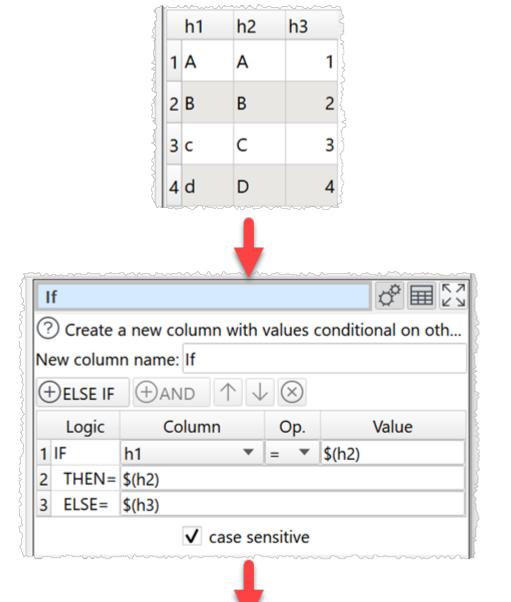

Sets the value of a new column based conditionally on values in one or more other columns.

## **Examples**

Add a new column based conditionally on 'Payment' and 'Currency' columns:

If the 'h1' and 'h2' columns have the same value then use the value of the 'h2' column, otherwise use the value of 'h3' column (using <u>column variables</u>).:

	h1	h2	h3	lf			
1	A	A	1	A			
2	В	В	2	B			
3	с	С	3	3			
4	d	D	4	4			

One.

## Options

- Set **New column name** to the name of the new column you want to create.
- Click the (+)ELSE IF button to add a new IF/ELSE IF..THEN condition.
- Click the (+)AND button to add an AND to the selected IF/ELSE IF..THEN.
- Click the  $\bigotimes$  button to delete the selected IF/ELSE IF..THEN/AND.
- The Logic column shows the type of row.
- Set **Column** to the column you wish to match.
- Set **Op.** to the comparison operator.
- Set Value to the value you wish to compare.
- Check case sensitive to use case sensitive matching for text.

#### Notes

- The IF, THEN and ELSE values can use <u>column variables</u>, as in the second example above.
- You can simulate OR with multiple IF statements. For example:

IF x = 1 OR y = 2THEN 3

Is equivalent to:

```
IF x = 1
THEN 3
ELSE IF y = 2
THEN 3
```

- <u>Number</u>, <u>date</u> and <u>text</u> values are treated differently for **Equal to**, **Greater than**, **Less than**, **Greater than equal**, **Less than equal** and **Not equal to** operations.
  - If both values are numeric, a numeric comparison will be carried out. This is accurate to approximately 16 digits of precision.
  - If both values match a supported date formats in <u>Preferences</u>, a date comparison will be carried out.
  - $\circ$  Otherwise the values will be treated as text.
  - For example, an empty value is considered less than 0, because they will be compared as text. So you might want to <u>replace empty values with 0</u> or remove those rows with <u>Filter</u>, before comparing them.
- All values are treated as text for Contains, Starts with, Ends with, Matches regex, Is not, Doesn't start with, Doesn't end with and Doesn't match regex operations.

- Comparisons of text are whitespace sensitive. Cells with whitespace will not match Is
  empty. You can use <u>Whitespace</u> to remove whitespace before filtering and <u>Replace</u> to get
  of other unwanted characters (e.g. whitespace inside the text).
- See here for more details on <u>Regular expressions</u> (regex).

#### See also

• Lookup

#### 2.3.24 Impute

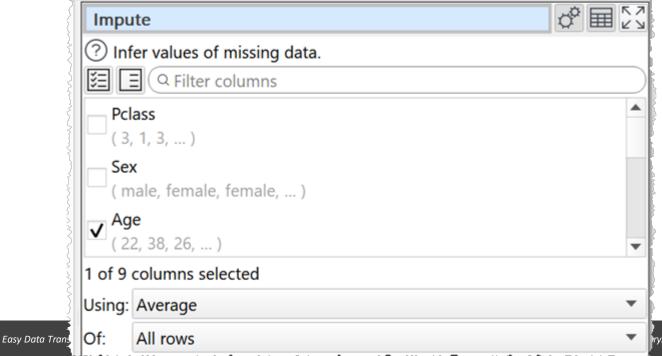

## Description

Infer values of missing data from other values in the same column.

## **Examples**

Impute the missing age of Titanic passengers based on the average age of all passengers:

	Pclass	Sex	Age	SibSp	Parch	-
21	2	male	35	0	0	
22	2	male	34	0	0	
23	3	female	15	0	0	
24	1	male	28	0	0	
25	3	female	8	3	1	
26	3	female	38	1	5	
27	3	male		0	0	
28	1	male	19	3	2	
29	3	female		0	0	
30	3	male		0	0	
31	1	male	40	0	0	

Impute the missing age of Titanic passengers based on the median age of passengers with the same passenger class and sex:

21       2       male       35       0         22       2       male       34       0         23       3       female       15       0         24       1       male       28       0         25       3       female       8       3         26       3       female       38       1         27       3       male       0       1         28       1       male       19       3         29       3       female       0       1         30       3       male       0       1         31       1       male       40       0         Felass (3, 1, 3,)         Sex (male, female, female, female,)         Age (22, 38, 26,)	0 0 0

	•
of 9 columns selected	

Rows with matching values for:

Of:

Ŧ

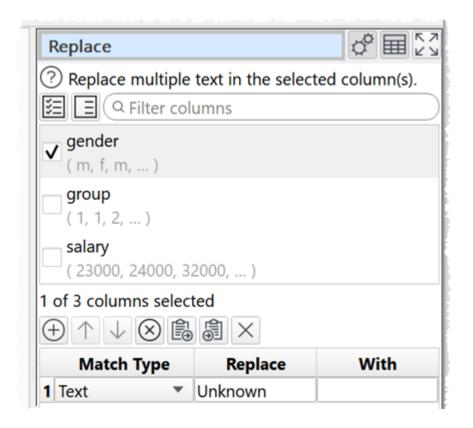

One.

# Options

- Check the column(s) which have empty values you wish to impute.
- Set **Using** to impute using the **Average** (mean), **Median** or **Mode** of non-empty data values in each column.
- Set **Of** to:
  - All rows to fill empty values in each column with the Average, Median or Mode of all non-empty values in the same column.
  - All rows with matching values for to fill empty values in each column with the Average, Median or Mode of all non-empty values in the same column where values match in the checked columns below.
- Set **Matching** to **Exact match** if every field has to match and **Best match** to use rows that have the most matching values (or all rows, if no matches). For example, if you are matching on passenger class and sex then:
  - **Exact match** will only use values from rows where the passenger class and sex both match.
  - **Best match** will use values from rows where the passenger class and sex both match, if available. Otherwise it will use values from rows where either the passenger class or sex match, if available. Otherwise it will use values from all rows.
- Check **case sensitive** to use case sensitive matching.

## Notes

- Average and Median only work on numerical data (non-numerical values are ignored).
- Mode treats all non-empty data values as text. Case and whitespace are taken into account.
- If **Mode** is selected and there are multiple values with the same maximum frequency, one will be picked at random.
- If you need to convert some values to empty before imputing, you can do this using a <u>Replace</u> transform.

- You can use a <u>Filter</u> transform to remove rows with missing values instead of imputing values.
- Use a <u>Sequence</u> transform to add missing date or integer values in a sequence before imputing.

#### 2.3.25 Insert

## Description

Append/prepend text to one or more columns.

## Example

Add 'ID-' to the front of a column of text:

One.

# Options

- Check the column(s) you wish to transform.
- In Insert put the text you want to insert. You can use a column variable.
- In **At** put the position you want the text inserted.

# Notes

• You can use Whitespace to remove whitespace before inserting.

# See also

- <u>Pad</u>
- Extract

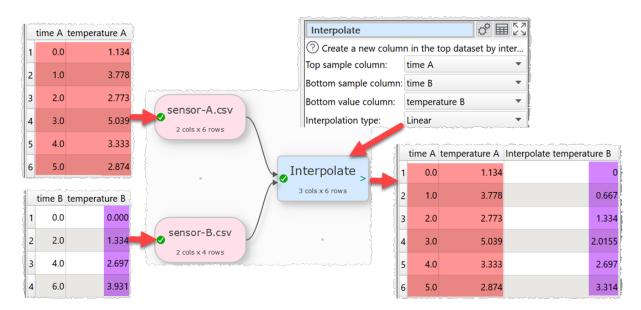

2.3.26 Interpolate

## Description

Interpolate values for a dataset based on numerical sample-value pairs in another dataset and puts the result in a new column.

# Example

Interpolate time and temperature datasets for sensors A and B with different sampling frequencies:

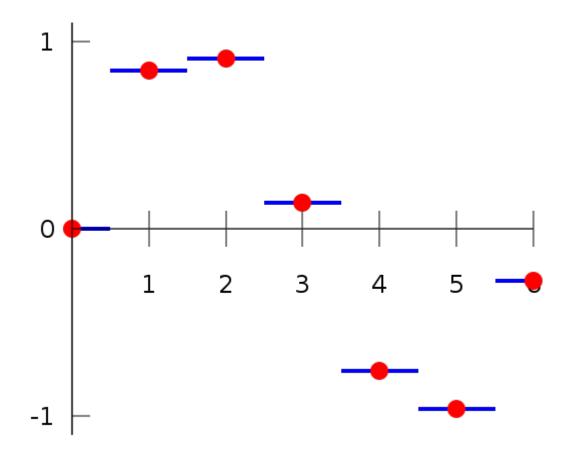

# Inputs

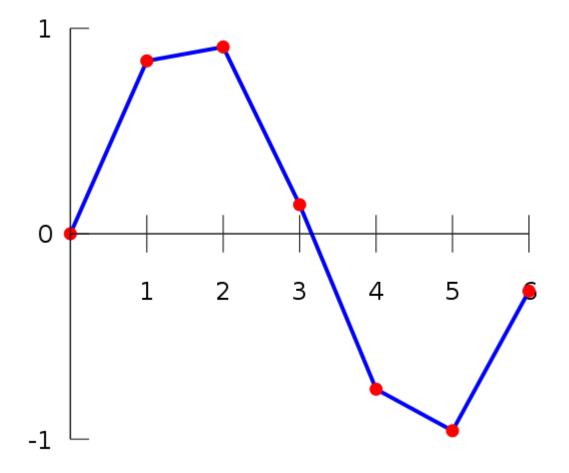

Two.

# Options

- Place the dataset you want to modify as the top input and the dataset you want to sample values from as the bottom input.
- Uncheck **automatic new column name** to set a name for the newly created column in **New column name**.
- Select **Top sample column** for the column whose values you wish to sample.
- Select **Bottom sample column** for the column that matches the top sample column in the bottom dataset.
- Select **Bottom value column** for the column that contains the values.
- Set Interpolation type to the type of interpolation you wish to use.

Piecewise interpolation (image from Wikipedia)

Linear interpolation (image from Wikipedia)

# Notes

- If your sample is below the first sample in the bottom dataset, the first value will be returned.
- If your sample is above the last sample in the bottom dataset, the last value will be returned.
- Easy Data Transform will try to guess sensible default values for **Top sample column**, **Bottom sample column** and **Bottom value column** based on column contents.
- If the first input has a header, this will be used for the output.
- The new column is added at the right end. You can change the column order with <u>Reorder</u> <u>Cols</u> and the column name with <u>Rename Cols</u>.
- Use <u>Num Format</u> to change the precision of the results.
- Messages are shown in the Warnings tab for non-numeric values in either dataset.
- Messages are shown in the **Info** tab for **Top sample column** outside the range of values in **Bottom sample column**.

2.3.27 Intersect

## Description

Keep only rows from the top dataset with key values that are present in the lower dataset.

## Example

Keep rows in the top dataset that also have their IDs in the bottom dataset:

## Inputs

Two.

# Options

- The output depends on the vertical (Y-axis) position of the inputs.
- Click Explore Keys... to compare key values in the 2 datasets.
- Select **Top key column** for the column you want to match in the top input dataset.
- Select Bottom key column for the column you want to match in the bottom input dataset.
- Check case sensitive to use case sensitive matching for keys.

## Notes

- If there are 10k rows or less in both datasets, Easy Data Transform will try to guess sensible default values for **Top key column** and **Bottom key column** based on column header names and contents.
- If the first input has a header, this will be used for the output.
- All values are treated as text and comparisons are whitespace sensitive. You can use <u>Whitespace</u> to remove whitespace before the intersect.
- Does not remove duplicates. You can use <u>Unique</u> to do this.
- You can use <u>Concat Cols</u> to join several columns together (e.g. 'first name' and 'last name' columns) to form a key column.
- You can use <u>Row Num</u> to create a unique key column.

#### 2.3.28 Javascript

# Description

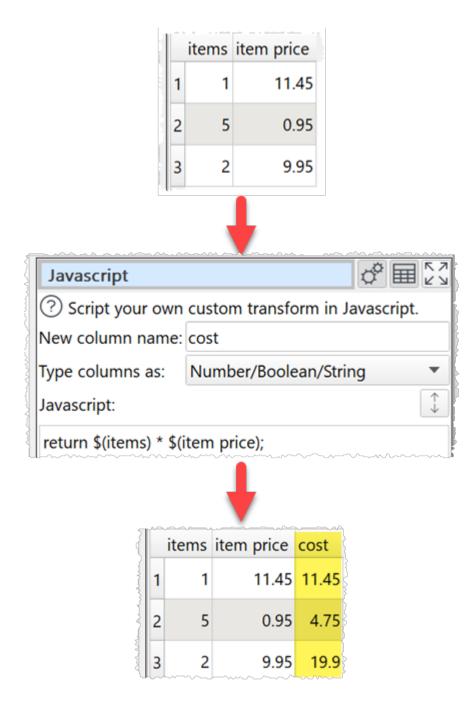

Create a custom transform using Javascript (ECMAScript).

Easy Data Transform allows you to carry out a wide range of data transformations without programming. But sometimes you might need a specialist transformation that can't be done with the built-in transforms. For that you can use the **Javascript** transform. It allows you to write the body of a Javascript function, to calculate a value for each row in a new column. Existing column values can be used as variables.

Javascript is a fully-fledged programming language and can perform arbitrarily complex transforms. It can handle strings (text), numbers, dates and text.

# **Examples**

Multiply the value in column 'items' by the value in column 'item price':

To concatenate 'last' and 'first' columns with a comma and a space:

return \$(last) + ', ' + \$(first);

To calculate the biggest of numeric columns 'v1' and 'v2':

return Math.max( (v1), (v2));

To find the number of characters in column 'v1':

return String( \$(v1) ).length;

To determine whether phone numbers in the 'phone_num' column are valid using a regular expression:

```
const validPhoneNum = /^[\+]?[(]?[0-9]{3}[)]?[-\s\.]?[0-9]{3}[-\s\.]?
[0-9]{4,6}$/;
if ( validPhoneNum.test( $(phone_num) ) )
   return "valid";
else
   return "invalid";
```

To replace the last comma in the 'Location' column with a ';' using a regular expression:

return \$(Location).replace(/(.*),([^ ]*)\$/, '\$1;\$2');

To calculate the number of years difference between <u>Javascript compatible dates</u> in column 1 and column 2:

```
return new Date($(1)).getFullYear() - new
Date($(2)).getFullYear();
```

To calculate the number of milliseconds between a datetime in the 'datetime' column and 1st Jan 2000:

return new Date( \$(date) ) - new Date( "2000-01-01T00:00" );

To calculate the number of whole days difference between a date in the 'created' column and today (negative for future dates):

```
return Math.floor( ( new Date() - new Date( $(created) ) ) /
( 1000*60*60*24 ) );
```

To use the value of the 'n' column if it is a number and 0 if it isn't:

```
if ( isNaN( $(n) ) )
    return 0;
else
    return $(n);
```

To reverse the text in the 'key' column:

```
var a = $(key);
var newString = "";
for (var i = a.length - 1; i >= 0; i--) {
    newString += a[i];
}
return newString;
```

To convert meters to feet using a function:

```
function metersToFeet( x )
{
    return 3.28084 * x;
}
return metersToFeet( $(meters) );
```

# Inputs

One.

# Options

- Set New column name to the name of the new column you want to create.
- Set Type column as to:
  - o Number/Boolean/String to pass:
    - A column that is numeric values as Javascript Number type.
    - A column that is true and false values as Javascript Boolean type.
    - Anything else as Javascript String type.
  - o String to pass data all columns with Javascript String type.
- Enter your script into the **Javascript** field. The script should be the body of a Javascript function.
- Select a column from **Insert variable** to add that <u>column variable</u> into the **Javascript** field at the current cursor position.
- Click the **Evaluate** button to evaluate your Javascript expression over every row and show any errors (only available if **Run>Auto Run** is checked).

# Notes

- If Run>Auto Run is checked, the Javascript transform is calculated every time:
  - The **Evaluate** button is pressed.
  - The **Javascript** transform item is unselected in the **Center** pane and script changes have been made without the **Evaluate** button being clicked.
  - o An item upstream of it changes.
- An empty string is passed as an empty Javascript string variable (""), not null. To test if the 'v' column has an empty value:

```
if ( $(v).length === 0 )
{
    // empty cell
}
else if ( String( $(v) ).trim().length === 0 )
{
    // blank cell (whitespace only)
}
```

- Numeric values should use dot ('.') as the decimal separator and have no group separator.
   E.g. 1234.5 is valid, but 1,234.5 and 1.234,5 are not, regardless of the <u>locale</u>. You can use the <u>Num Format</u> and <u>Replace</u> transforms to put numeric data in the correct format before processing a **Javascript** transform.
- The new column is added at the right end. You can change the column order with <u>Reorder</u> <u>Cols</u> and the column name with <u>Rename Cols</u>.
- The Javascript Date() object evaluates to the number of milliseconds since 1 January 1970 UTC.
- Date values passed to Javascript Date() objects should be in ISO ('yyyy-mm-dd') format, e.g. '2020-01-31' (not '2020-1-31').
- If you want to carry out your transform across more than one dataset, you should merge them first, e.g. using <u>Join</u>.
- The Javascript transform is very versatile and quite fast. But is not as fast as built-in transforms. So we recommend you use built-in transforms where possible.
- Javascript running in Easy Data Transform is not 'sandboxed' and has the same privileges as the Easy Data Transform executable. However the Javascript does not have access to window(), XMLHttpRequest() or ActiveXObject(). So we aren't aware of any way that a bad actor could damage your system from Javascript sent in a .transform file.
- Javascript is far too big a topic to cover here. However there are many detailed resources online. If you are stuck <u>contact support</u>.
- If you only want to combine text from columns, use the simpler <u>Substitute</u> transform.
- Warnings are shown in the **Warnings** tab for:
  - $_{\odot}$  Javascript syntax errors
  - $\circ$  Ambiguous column references
- For simple arithmetic operations on numbers and dates use the <u>Calculate</u> transform.

# See also

• Find the difference between dates/datetimes

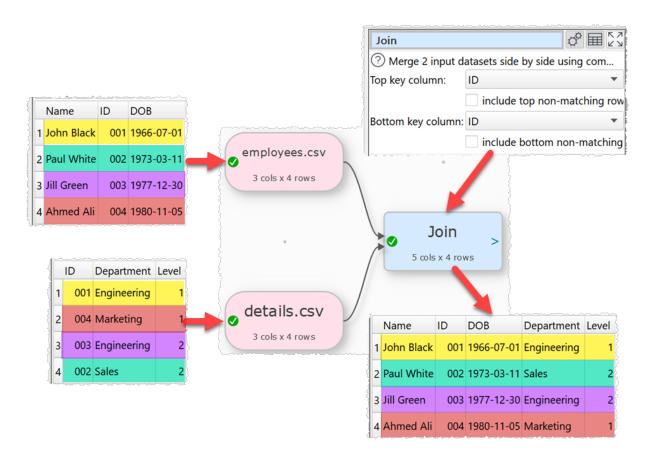

#### 2.3.29 Join

## Description

Merge two inputs based on common (key) columns, e.g. on an email address or ID column present in both inputs. The bottom dataset (by vertical position) is joined to the right of the top dataset.

# Example

Join two datasets side-by-side using the 'ID' columns:

Two.

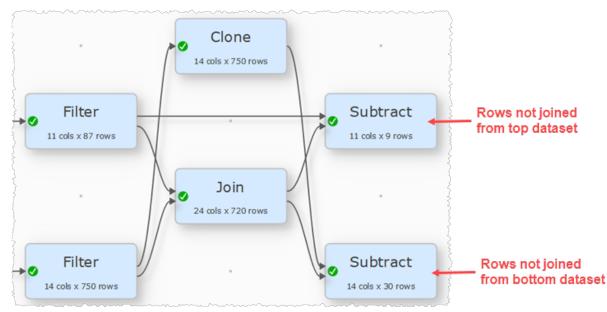

# Options

- The output depends on the vertical (Y-axis) position of the inputs.
- Click Explore Keys... to compare key values in the 2 datasets.
- Select Top key column for the column you want to match in the top input dataset.
- Select **include top non-matching rows** if you want to include in the output any rows in the top input with no matching value in the bottom input.
- Select Bottom key column for the column you want to match in the bottom input dataset.
- Select **include bottom non-matching rows** if you want to include in the output any rows in the bottom input with no matching value in the top input.
- Check **detailed report** to show detailed information in the **Warnings** and **Info** tabs on duplicate keys in each dataset, overlap of keys in the 2 datasets and leading and trailing whitespace in keys. This slows down the join significantly.
- Check **case sensitive** to use case sensitive matching for keys.

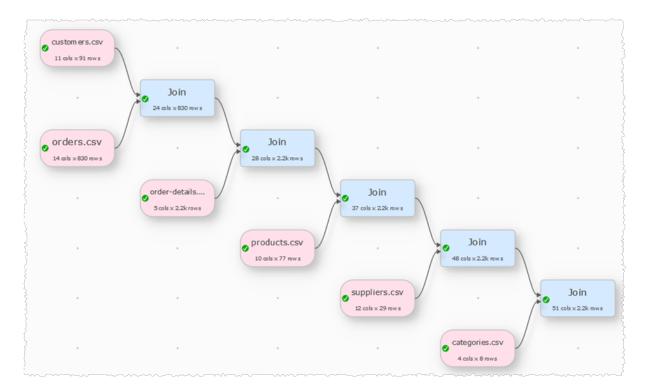

include top non-matching rows checked	include bottom non- matching rows checked	Also known as:
No	No	Inner join
No	Yes	Right outer join
Yes	No	Left outer join
Yes	Yes	Full outer join

## Notes

- Join merges two datasets side-by-side (horizontally). To merge datasets one on top of the other (vertically) use <u>Stack</u>.
- If there are 10k rows or less in both datasets, Easy Data Transform will try to guess sensible default values for **Top key column** and **Bottom key column** based on column header names and contents.
- All values are treated as text. You can use <u>Whitespace</u> to remove whitespace before the join.
- If a key value occurs M times in the first dataset and N times in the second dataset, you will get M x N rows with this key value. You can use <u>Unique</u> to remove rows with duplicate key values.
- If you need more than one column for the key, use <u>Concat Cols</u> to create that column.
- Use <u>Row Num</u> to create a unique key column.
- Use <u>Sort</u> to sort the results.
- Use the <u>Cross</u> transform for cross joins.
- Messages are shown in the **Warnings** tab for keys that occur more than once in either dataset (duplicates).
- Messages are shown in the Info tab for keys that only occur in 1 of the 2 datasets (misses).
- Use <u>Subtract</u> to see rows not joined from the top or bottom dataset (an 'anti-join'). The <u>Clone</u> is necessary to get the correct Y position of the bottom dataset for the **Subtract**.

• Cascade multiple joins to join more than 2 datasets.

- Merge datasets

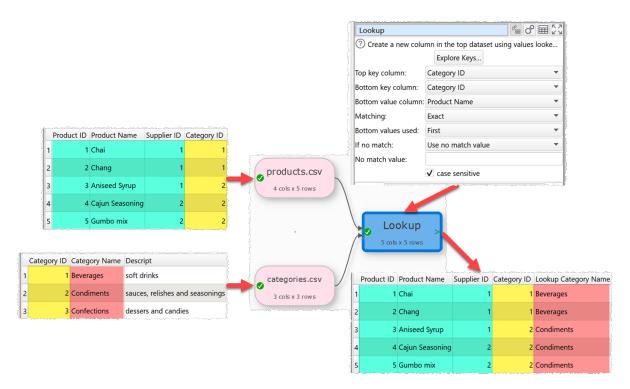

## 2.3.30 Lookup

## Description

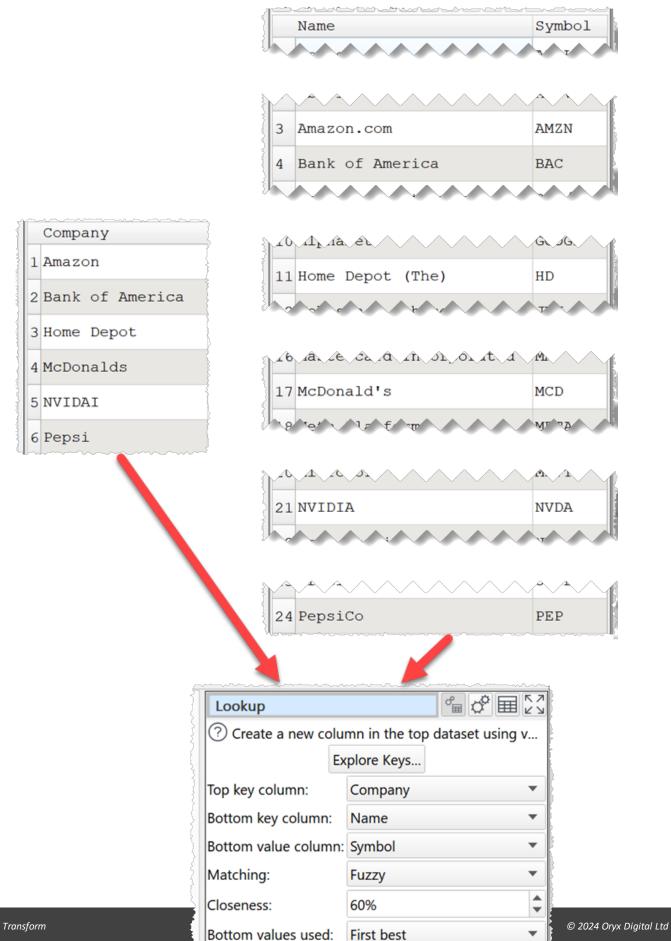

Looks up the values of a column in the top input dataset in the bottom input dataset and puts the result in a new column.

## **Examples**

Lookup category name in a second dataset using 'Category ID':

Fuzzy lookup of company stock 'Symbol' by 'Name':

Easy Data Transform

Two.

# Options

- Place the dataset you want to modify as the top input and the dataset you want to lookup values from as the bottom input.
- Click Explore Keys... to compare key values in the 2 datasets.
- Uncheck **automatic new column name** to set a name for the newly created column in **New column name**.
- Select **Top key column** for the column whose values you wish to lookup.
- Select **Bottom key column** for the column that matches the lookup in the bottom dataset.
- Select **Bottom value column** for the column that contains the values.
- Set **Matching** to **Exact** to use exact matching to find duplicates and **Fuzzy** to match with some differences. <u>Fuzzy matching</u> is much slower.
- Set **Closeness** to how close a fuzzy match has to be to be considered a match. E.g. set it to 80% to make 2 values that are 80% the same a match. For **Fuzzy** matching only.
- Set Bottom values used to:
  - $\circ$  All if you want to use all matches. Duplicate values are only shown once.
  - o First if you want use the first match in Bottom lookup column. For Exact matching only.
  - **All best** if you want to use the best matches. If there are multiple values that are equally good, use all of them. Duplicate values are only shown once. For **Fuzzy** matching only.
  - **First best** if you want to use the best match. If there are multiple values that are equally good, use the first one. For **Fuzzy** matching only.
- Set **Delimiter** to the delimiter you want to use to separate multiple values returned for **Bottom values used** of **All** or **All best**.
- Set **If no match** to **Use not match value** or **Leave unchanged**, depending on what you want to do for values in **Top lookup column** that do not match in **Bottom lookup column**.
- Set **No match value** to the value you want to use for values in **Top lookup column** that do not match in **Bottom lookup column** when **If no match** is set to **Use no match value**.
- Check **case sensitive** to use case sensitive matching for keys.

# Notes

- Easy Data Transform will try to guess sensible default values for **Top lookup column**, **Bottom lookup column** and **Bottom value column**.
- Bottom values used is only important if there are duplicate values in the Bottom lookup column.
- If the top input has a header, this will be used for the output.
- If you want to see what bottom dataset keys are matched to each top dataset key, you can set **Bottom value column** to the same column as **Bottom key column**.
- All values are treated as text and comparisons are whitespace sensitive. You can use <u>Whitespace</u> to remove whitespace before the lookup.

- The new column is added at the right end. You can change the column order with <u>Reorder</u> <u>Cols</u> and the column name with <u>Rename Cols</u>.
- Warnings are shown in the Warnings tab for:
  - $_{\odot}$  Values that cannot be found in the bottom dataset (misses).
  - Values that occur more than once in the bottom dataset (duplicates), if Bottom values used is First.

- <u>Join</u>
- 2.3.31 Moving

# Description

Add a new column with a moving average/median/sum/min/max of the selected column.

# **Examples**

Calculate a 7 day moving average for the sales column, leaving the first 6 days empty.

	Date	Sales
1	2020-07-01	100
2	2020-07-02	120
3	2020-07-03	90
4	2020-07-04	145
5	2020-07-05	95
6	2020-07-06	75
7	2020-07-07	125
8	2020-07-08	130
9	2020-07-09	95

# .

Moving								
? Add a new column with a moving average/sum/								
Column:	Sales 💌							
Calculation:	Average 💌							
Interval:	7							
Offset:	0							
Incomplete values:	Set empty 🔹							

 ~			A			_
Date		Sales	Moving	Average	Sales	
1	2020-07-01	100				~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
2	2020-07-02	120				
3	2020-07-03	90				Э.

ah.

Calculate the sum of the current row and the rows above and below, where available, for the sales column.

	Date	Sales
1	2020-07-01	100
2	2020-07-02	120
3	2020-07-03	90
4	2020-07-04	145
5	2020-07-05	95

Moving	° 🖬 🗘 🗐 🗋	
? Add a new colu	umn with a moving average/sum/	·
Column:	Sales	٣
Calculation:	Sum	٣
Interval:	3	÷
Offset:	1	•
Incomplete values:	Calculate from available	Ŧ

-		~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~	
{ }	Date	Sales Moving	Sum Sales
	1 2020-07-01	100	220
	2 2020-07-02	120	310
	3 2020-07-03	90	355
	4 2020-07-04	45	330
}	5 2020-07-05	95	240

One.

# Options

- Uncheck **automatic new column name** to set a name for the newly created column in **New column name**.
- Select the **Column** you wish to calculate a moving average/median/sum/minimum/maximum for.
- Set Calculation to the statistic to be calculated.
  - **Average** shows the arithmetic mean of the values in the interval (Simple Moving Average).
  - $\circ$  **Median** shows the median of the values in the interval.
  - o **Sum** show the sum of the values in the interval.
  - o Minimum shows the smallest value in the interval.
  - **Maximum** shows the largest value in the interval.
- Set **Interval** to the number of rows to include in each moving average/median/sum/minimum/maximum value.
- Set **Offset** to the number of rows above (if negative) or below (if positive) the current row to end each interval at.
- Set **Incomplete values** according to what you want to show for rows without a full interval of data. For example the first 6 rows when **Interval** is 7 and **Offset** is 0.

## Notes

- Non-numeric values are ignored. E.g. a 7 day moving average that includes 2 non-numeric values will be shown as an average of the 5 numeric values.
- You will be warned of any non-numerical values in the selected column.

# See also

- <u>Video: How to calculate moving averages</u>
- <u>Offset</u>
- <u>Stats</u>

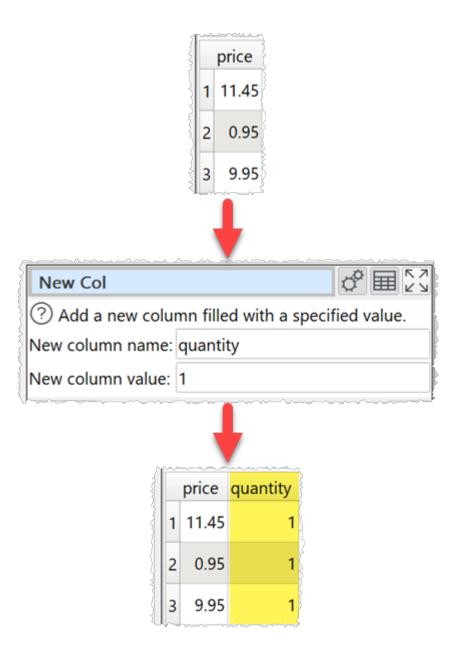

#### 2.3.32 New Col

# Description

Adds a new column, filled with a given value.

# Example

Add a new column full of '1' values:

One.

# **Options**

- Set New column name to the name of the new column you want to create.
- Set **New column value** to the value for every cell of the new column. You can leave it empty for an empty column.

## Notes

• New columns are always added at the right end. You can change the column order with <u>Reorder Cols</u> and the column name with <u>Rename Cols</u>.

# See also

- Copy Cols
- <u>Remove Cols</u>
- 2.3.33 New Rows

# Description

Add new rows.

# Examples

Add an empty row above every row with an invoice number:

		Invo	oice	Line Item		Value		
	1	0	0456		1	150.00	0	
	2				2	95.00	<b>D</b>	
	3				3	50.0	<b>D</b>	
	4	0	0457		1	845.00	<b>D</b>	
	5				2	12.50	D	
U	4	~~~~~~	~~				~··	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
New Ro	<b>w</b>	s			V	<	\$ ■	
? Add i	ne	w ro	NS.	/5.				
Number	ad	ded:	Same for every row					
Number	val	ue:	1					
As:			Blank row(s)					
ocation:			Above each row					
For:			Rows where					
Column:			Invoice 🔹				•	
Matches:			!= N	ot equal to	)			•
/alue:								
			✓ ca	se sensitive	e			
			·····		~~		~~~~~~	_^
		Invo	oice	Line Item		Value		
	1						Normal New York	
	2	0	0456		1	150.00	0	

95.00

50.0

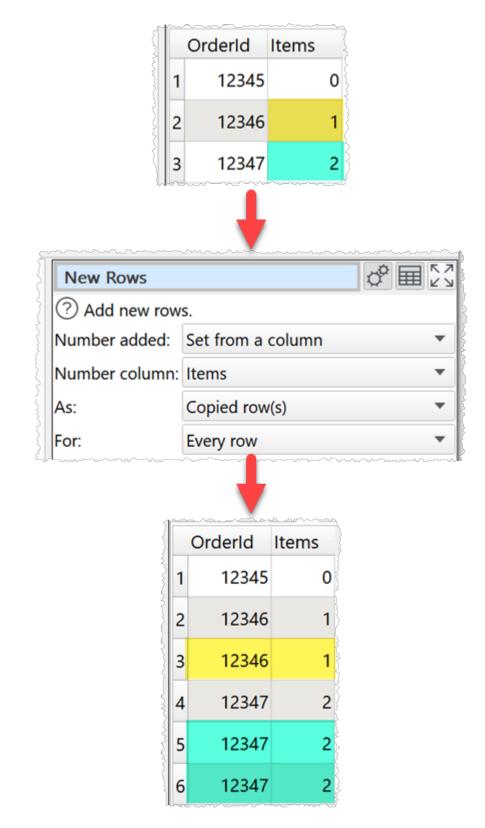

2

3

3

4

One.

# **Options**

- Set **Number added** according how many rows to add for each existing row.
  - Set **Number value** to the number of new rows to create for each existing row (available when **Number added** is **Same for every row**).
  - Set **Number column** to get the number of new rows to create for each existing row from a column (available when **Number added** is **Set from a column**).
- Set As to add either blank rows, copies of existing rows or user defined rows.
- Set **With value** to set the value used for each column of the new row (available when **As** is **User defined row(s)**).
- Set **Location** depending on whether you want new rows added above or below existing rows (available when **As** is **Blank row(s)** or **User defined row(s)**).
- Set **For** depending on whether you wish to add rows to all rows, only rows that meet certain conditions or only the first or last rows.

# Notes

 You can use <u>Calculate</u> or <u>Javascript</u> transforms to calculate the number for the **Number** column. E.g. to subtract 1 from the final number of copies wanted to give the number of new rows.

# See also

- <u>Offset</u>
- <u>Sequence</u>

## 2.3.34 Ngram

## Description

Counts the number of times each sequence of consecutive words appear in the selected column.

# **Examples**

Find ngrams of 2 to 3 word length (bigrams and trigrams) in the 'Keywords' column:

	Keywords	Impressions			
1	EDT	47			
2	easy data transform	1598			
3	Easy Data Transform	964			
4	easy data transformer	345			
5	data transformer	19343			
6	EASY,DATA,TRANSFORM	23			

Ngram	♂ ■			
? Count see	quences of N consecutive words in the	sel		
Column:	Keywords	•		
Minimum N:	2	-		
Maximum N:	3	*		
Sum: Rows				
	case sensitive			

	Keywords Ngrams	Words	Rows
1	easy data transform	3	3
2	easy data transformer	3	1
3	easy data	2	4
4	data transform	2	3
5	data transformer	2	2

Sum the impressions associated with each 2 to 3 word ngram:

Ke	eywords	Impressions
1 EI	DT	47
2 ea	asy data transform	1598
3 Ea	asy Data Transform	964
4 ea	asy data transformer	345
5 da	ata transformer	19343
6 E/	ASY, DATA, TRANSFORM	23

Ngram	de 🔳	スコレン			
⑦ Count sequences of N consecutive words in the sel					
Column:	Keywords	•			
Minimum N:	2	\$			
Maximum N:	3	-			
Sum:	Impressions	•			
	case sensitive				

L

	Keywords Ngrams	Words	Impressions
1	easy data transform	3	2585
2	easy data transformer	3	345
3	data transformer	2	19688
4	easy data	2	2930
5	data transform	2	2585

One.

# **Options**

- Select the **Column** you wish to analyze for ngrams.
- Set **Minimum N** to the minimum number of words in an ngram.
- Set Maximum N to the maximum number of words in an ngram.
- Set **Sum** to:
  - $\circ$  **Rows** to count the number of rows containing the ngram.
  - A column to sum numeric values in that column for all rows containing the ngram.
- Uncheck **case sensitive** to convert everything to lower case before counting ngrams.
- Check **drilldown** to allow double clicking a row in the data table to <u>drilldown</u> to the rows that contributed to this row in the upstream data.

# Notes

- Words are made up of letters, digits and apostrophes ('). All other characters are treated as word separators.
- All letters are converted to lower case.
- If you have set **Sum** to a column then only numeric values in that column will be summed.
- The output sorted by number of words in the ngram, then the count and then the ngram. Use a <u>Sort</u> transform to sort it in a different order.
- Use a <u>Replace</u> transform before the **Ngram** transform to remove/replace any words or letters you don't wish to analyze.

# See also

- <u>Unique</u>
- <u>Total</u>
- <u>Pivot</u>
- <u>Stats</u>
- <u>Summary</u>

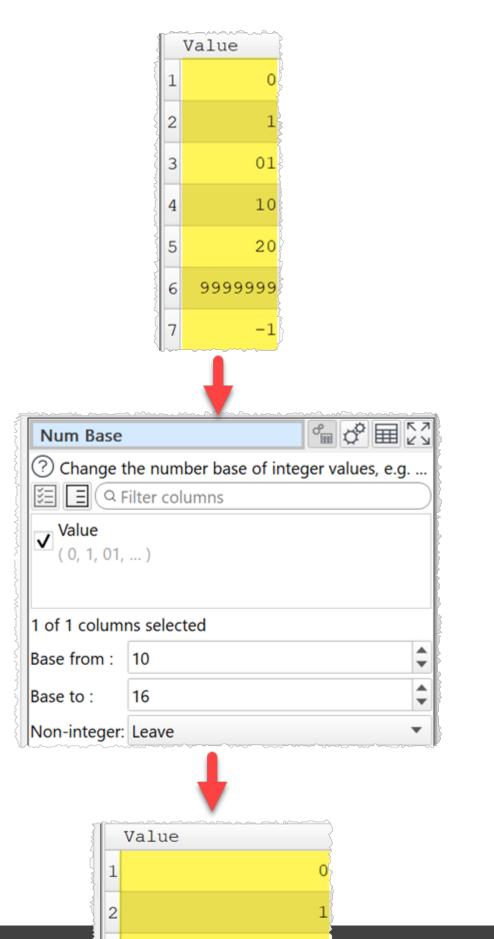

2.3.35 Num Base

## Description

Change the number base of integer values, e.g. decimal to hexadecimal.

# **Examples**

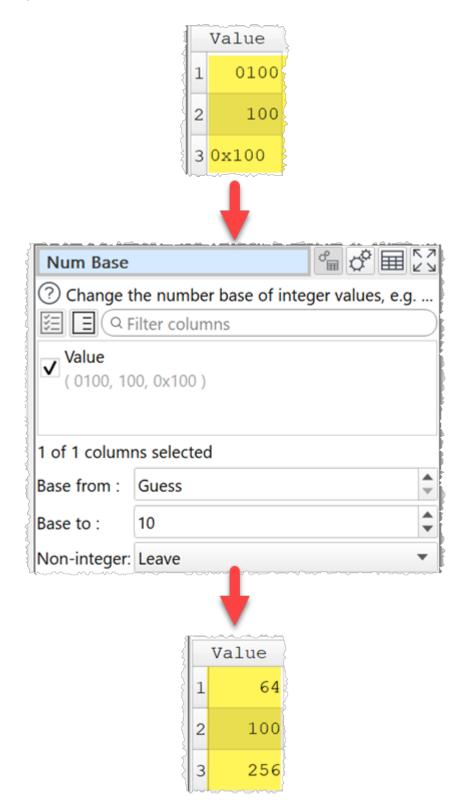

Convert from decimal (base 10) to hexadecimal (base 16):

1

3

Convert from guessed base to decimal (base 10):

One.

# Options

- Check the column(s) you wish to convert.
- Set **Base from** to the base of the current values. If you set it to **Guess**, it will guess the base for each column by looking at some of the values, Numbers starting with 0x (e.g. 0x123) are assumed hexadecimal (base 16). The base guessed in output in the **Info** tab.
- Set **Base to** to the base wanted.

# Notes

- The values to be converted should be integers (whole values) without group separators (e.g. no commas or decimal points).
- If **Base from** and **Base to** are the same, no change is made.
- Negative numbers are represented using unsigned values (e.g. twos complement for binary) if **Base to** is anything other than 10.
- Warnings are shown in the Warnings tab for non-integer values.
- Use Copy Cols to copy columns before conversion.
- Use <u>Num Format</u> to change the format of numbers (e.g. remove group separators).
- You can use <u>Insert</u> to add characters to the front of values, e.g. to add '0x' to hexadecimal values.

# See also

- Video: How to convert base
- <u>Decode</u>

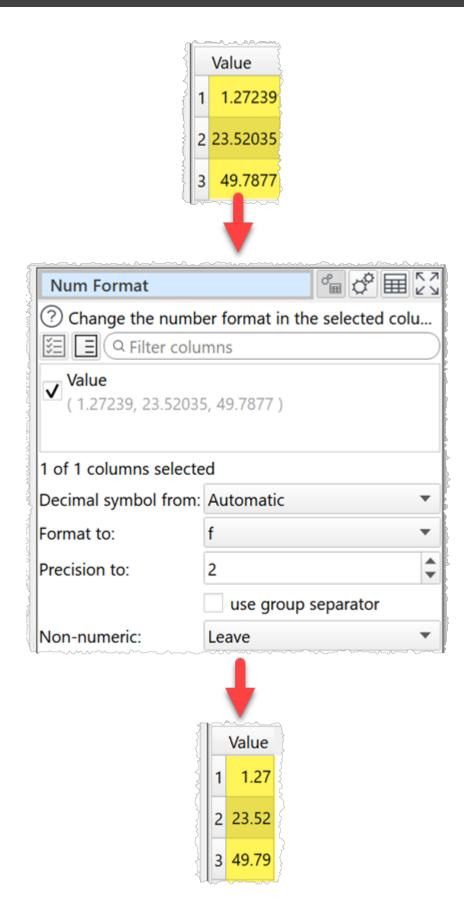

#### 2.3.36 Num Format

## Description

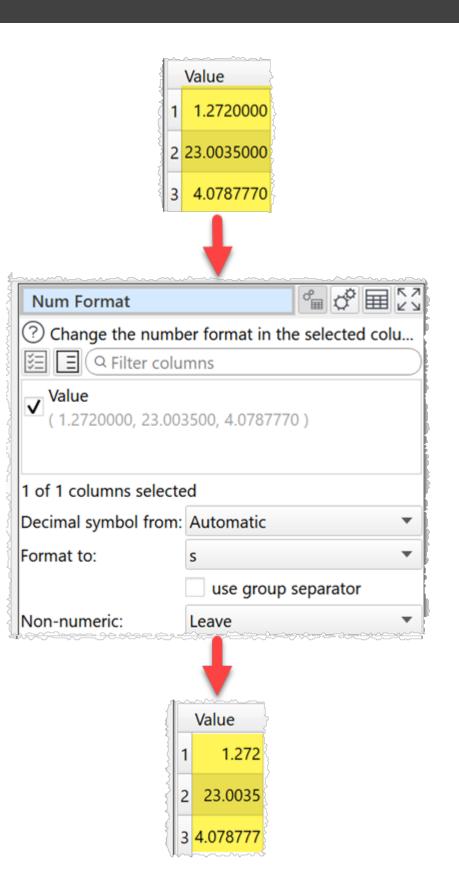

Change the number format in one or more columns.

# **Examples**

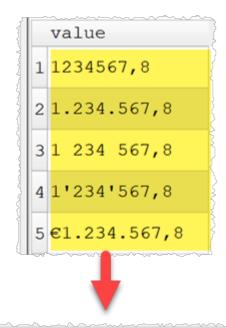

Set numeric values to 2 decimal places:

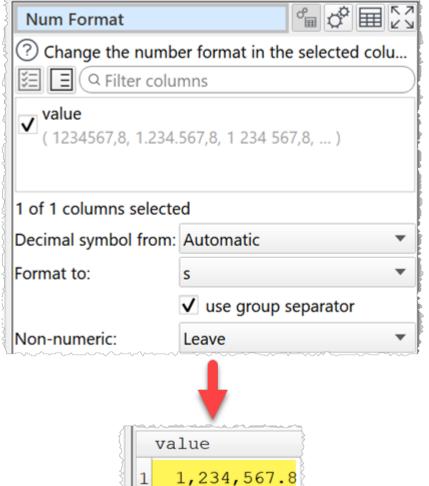

Set numeric vales to the shortest accurate number:

Change European style numbers to US/UK style locale numbers (**Preferences>General>Locale** set to **United States**):

1,234,567.8

1,234,567.8

1,234,567.8

2

3

4

One.

# Options

- Check the column(s) you wish to transform.
- Set **Decimal symbol from** according to the decimal separator in the input dataset:
  - **Automatic**: Make an intelligent guess for each column, based on the input data. This is usually the best choice.
  - $\circ$  US/UK . (dot): Use . (dot) as the decimal separator.
  - $\circ$  European , (comma): Use , (comma) as the decimal separator.
  - Locale in Preferences: Use the decimal separator from Locale in the <u>Preferences</u> window.
- Set Format to to the new number format (see below).

Format to	Meaning
е	Format as [-]9.9e[+ -]999. E.g. 1234567.89 is shown as 1.235e+06.
E	Format as [-]9.9E[+ -]999. E.g. 1234567.89 is shown as 1.235E+06.
f	Format as [-]9.9. E.g. 1234567.89 is shown as 1234567.89.
g	Use e or f format, whichever is the most concise.
G	Use E or f format, whichever is the most concise.
S	The shortest accurate representation for the given number without exponents. E.g. 1234567.00 is shown as 1234567.

- Set **Precision to** to the precision desired.
  - For the **e**, **E**, and **f** formats, **Precision to** represents the number of digits after the decimal point.
  - For the g and G formats, Precision to represents the maximum number of significant digits (trailing zeros are omitted).
  - $\circ~$  For the  $\boldsymbol{s}$  format  $\boldsymbol{Precision~to}$  is ignored.
- Check use group separators to include the group separators for your <u>locale</u>. E.g. to turn 1234567 to 1, 234, 567 for a UK or US locale.
- Set **Non-numeric** according to what you want to do with non-numeric values in transformed columns. NaN means Not a Number.

# Notes

- The locale is used to decide how the number is output (e.g. group and decimal separators).
- Numbers should be <u>base 10</u> (decimal).
- \$,  $\pm$  and  $\in$  characters are ignored.
- If **Decimal symbol from** is set to **Locale in Preferences** the allowed group separators are set by the locale. Otherwise dot (if not used as the decimal separator), comma (if not used as the decimal separator), whitespace (including thinspace) and apostrophe characters are ignored.
- You can also use Extract and Pad to change the number of characters.
- Warnings are shown in the **Warnings** tab for non-numeric values.

# See also

- Video: How to convert decimal separators and number formats
- DateTime Format

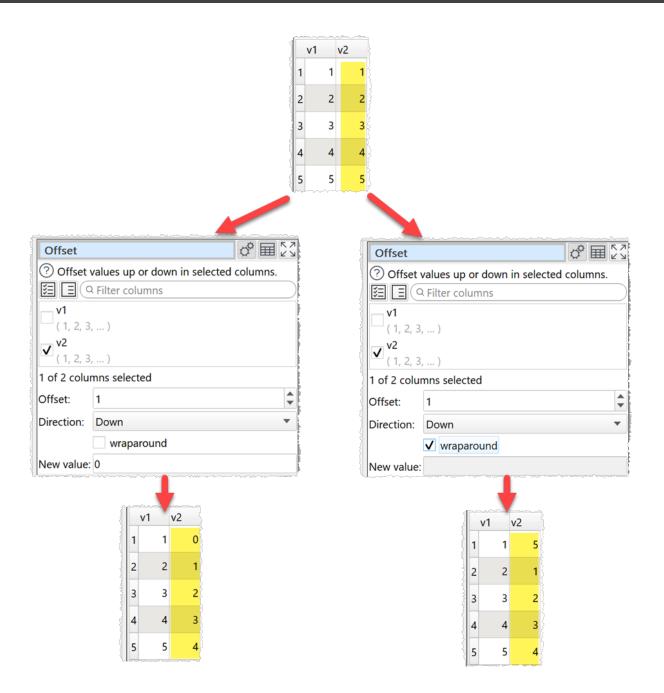

#### 2.3.37 Offset

# Description

Moves values in selected columns up or down.

# Example

Move the 'v2' values down 1:

One.

# Options

- Check the column(s) you wish to transform.
- Set **Offset** to the number of rows you wish to offset values by.
- Set **Direction** to the direction you want to offset in.
- Check **wraparound** if you want values pushed off the bottom of the table to be added to the top or values pushed off the top to be added to the bottom.

• Set **New value** to the value you wish to set for any cells newly created by the offset.

### Notes

• You can use <u>Copy Cols</u> to create copies of columns before you offset them.

### See also

- <u>New Rows</u>
- <u>Slide</u>

#### 2.3.38 Outliers

### Description

Find outlier numerical values.

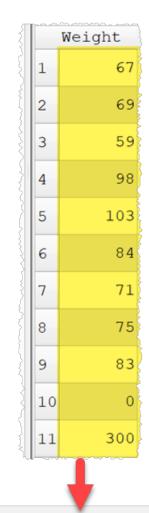

### **Examples**

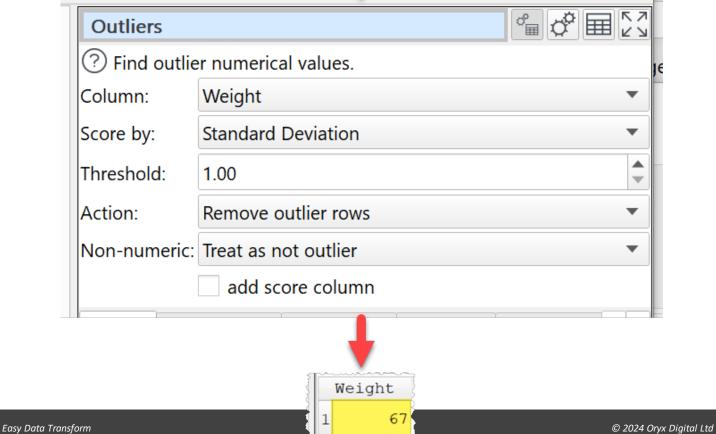

Set outliers empty based on quartiles and add a column with the outlier score:

Outliers	°∎¢≡[3
? Find out	er numerical values.
Column:	Height <b>•</b>
Score by:	Inter Quartile Range
Threshold:	1.50
Action:	Set value 💌
Value:	
Non-numeric	Treat as not outlier
	✓ add score column

Remove rows with values that are more than 1 Standard Deviation from the mean:

One.

### Options

- Select the column you wish to check for outliers.
- Set Score by depending on how you wish to score outliers.
  - **Inter Quartile Range** scores values on how far they are above Q3 or below Q1 as proportion of the Inter Quartile Range. For example:
    - A value 2 IQRs above Q3 scores 2.0.
    - A value 1 IQR below Q1 scores -1.0.
    - A value between Q3 and Q1 scores 0.0.
  - **Standard Deviation** scores values on how many deviations they are from the average (mean). This is also known as a Z-score. For example:
    - A value 2 Standard deviations above the average scores 2.0.
    - A value 1 Standard deviations below the average scores -1.0.
- Any score that is greater than Threshold or less than -Threshold is considered an outlier.
   E.g. if the threshold is 1.5 then values that scores more than 1.5 or less than -1.5 are considered outliers. The corresponding upper and lower 'fence' values are shown in the Info tab.
- Set **Action** to the action to take for outliers:
  - **Change to threshold**: Value greater than the upper fence value or less than the lower fence value are set to the nearest fence value. Non-numeric values are not changed, as it isn't clear which fence value to set them to.
  - o **Remove outlier rows**: Rows with outlier values are removed.
  - Keep outlier rows: Only rows with outlier values are kept.
  - Set value: Outlier values are changed to the value provided in the Value field.
- Set Non-numeric depending on whether you want to treat non-numeric values as outliers.
- Check add score column if you want to add an extra column with the outlier scoring.

#### Notes

- Warnings are shown in the Warnings tab for non-numeric values.
- Use <u>Num Format</u> to change the format of numbers (e.g. remove group separators).
- Use Impute to impute any missing values.
- Use <u>Sort</u> to sort by values in the score column.
- You can convert dates into numerical values (e.g milliseconds since 1970 or Julian day) using <u>Calculate</u> or <u>Javascript</u>.

See also:

• Video: How to find outliers in data

# Reference

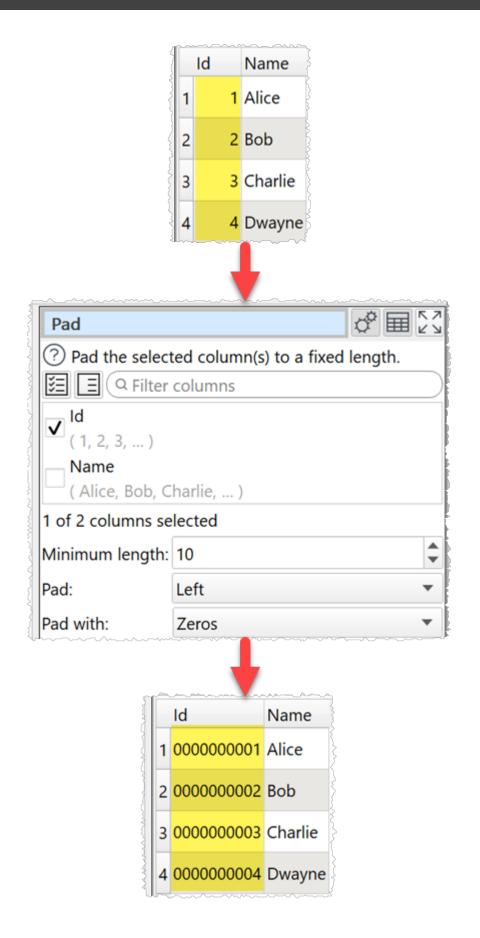

#### 2.3.39 Pad

### Description

Pad text to a minimum length in one or more columns.

## Example

Pad the 'Id' column to 10 digits using zeros:

One.

### **Options**

- Check the column(s) you wish to transform.
- Set **Minimum length** to the length you want values in selected columns padded to. Values this length or longer are unaffected.
- Set **Pad** to **Left** or **Right** depending on where you want any padding characters added.
- Set Pad with to the character you want to pad with.

#### Notes

• Whitespace is counted when calculating length. You can use <u>Whitespace</u> to remove whitespace before padding.

#### 2.3.40 Pivot

### Description

Creates a pivot table to summarize values for one or two columns.

### Example

Pivot to sum 'Amount' by 'Area' and 'Currency':

	Area	Currency	Amount
1	Europe	EUR	13937.00
2	North America	USD	22894.90
3	Africa	ZAR	12745.55
4	North America	USD	48356.95
5	Europe	GBP	1100.00
6	Europe	EUR	5905.80
	, , ,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,,		

Pivot	1	°≡∷
? Create a pivot ta	able to summarize the	selected
Columns:	Currency	•
Rows:	Area	•
Values:	Amount	•
Summarize by:	Sum	•
Set non-calculated:	Zero	•
[	✓ add totals	
Total by:	Rows and columns	•

	Area	EUR	GBP	USD	ZAR	Grand Sum
1	Africa	0	0	0	12745.55	12745.55
2	Europe	19842.8	1100	0	0	20942.8
3	North America	0	0	71251.85	0	71251.85
4	Grand Sum	19842.8	1100	71251.85	12745.55	104940.2

One.

### **Options**

- Set **Columns** to the column values you want to use as columns in your pivot table.
- Set Rows to the column values you want to use as rows in your pivot table.
- Set Values to the column you wish to summarize.
- Set **Summarize by** to how you wish to summarize the values:
  - $\circ$  **Sum** show the sum of the values. Non-numeric and empty values are ignored.
  - o Minimum shows the smallest value. Non-numeric and empty values are ignored.
  - o Maximum shows the largest value. Non-numeric and empty values are ignored.
  - **Average** shows the arithmetic mean of the values. Non-numeric and empty values are ignored.
  - **Median** shows the median of numeric values in the column. Non-numeric and empty values are ignored.
  - Mode shows the mode of numeric values in the column. Non-numeric and empty values are ignored.
  - **Standard deviation** is the sample standard deviation (equivalent to Excel function stddev.s). Non-numeric and empty values are ignored.
  - Count shows the number of non-empty values. A value that contains whitespace or 0 is not considered empty.
  - Count distinct show the number of non-empty values. Duplicates are not counted. A value that contains whitespace or 0 is not considered empty.
- Set **Set non-calculated** depending on how you want to set cells not calculated by the pivot.
- Check add totals to add row and/or column totals.
- Set Total by depending on whether you want to total by Rows and columns, Rows or Columns. This is only available if add totals is checked and Columns and Rows are selected.
- Check **drilldown** to allow double clicking a cell in the data table to <u>drilldown</u> to the rows that contributed to this value in the upstream data.

#### Notes

- Column and row values are ordered alphabetically. You can change the order using <u>Reorder Cols</u> (for columns) and <u>Sort</u> (for rows).
- **Mode** may not work as expected with non-integer values, due to precision issues. You can fix this by using a <u>Num Format</u> transform first.
- Use Num Format to change the precision of the results.
- Use <u>Scale</u> to convert the results to percentages.
- To add a column of 1 values to **Sum** (e.g. to find out how many rows a value occurs in) use a <u>New Col</u> transform.

## See also

- <u>Count</u>
- <u>Stats</u>
- <u>Summary</u>

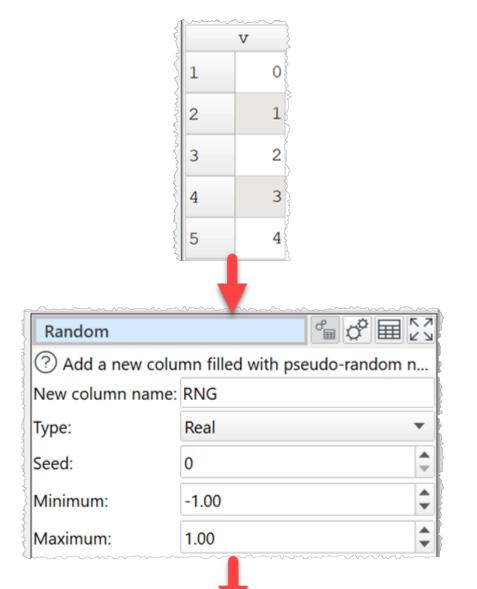

### 2.3.41 Random

### Description

Adds a new column, filled with pseudo-random numbers.

### Example

Add a new column of random real values between -1 and +1:

	······································	
	v	RNG
1	0	-0.3584059983
2	1	0.0231829141
3	2	-0.5275243884
4	3	-0.6523676871
5	4	0.7553240687

One.

### Options

- Set **New column name** to the name of the new column you want to create.
- Set **Type** depending on whether you wish to generate **Real** (floating point) or **Integer** (whole number) values.
- Set **Seed** to the seed value used by the pseudo-random generator algorithm.
- Set **Minimum** to the minimum value you want to generate. The value may be equal to minimum, but not less.
- Set **Maximum** to the maximum value you want to generate. The value may be equal to maximum, but not more.

#### Notes

- The numbers output are a sequence of pseudo-random numbers based on the **Seed** value.
- The same sequence is always output for the same options.
- The default **Seed** value is based on the system clock when the transform was first created.
- To generate random text (strings) use **Random** with **Type** set to **Integer** and then use the results in conjunction with <u>Lookup</u> to lookup text values using an integer key.
- To generate random dates or datetimes then use Random with Type set to Integer and then use the results in conjunction with <u>Calculate</u> with **Operation** set to MSecsToDateTime.
- To generate a real random value between numerical values in Min and Max data columns: • Generate real values between 0 and 1 using **Random**.
  - o Use the Javascript transform to calculate a new value in the desired range, e.g.:

return ( \$(Max) - \$(Min) ) * \$(Random) + \$(Min);

- To generate passwords use **Random** in conjunction with the <u>Hash</u> transform.
- New columns are always added at the right end. You can change the column order with <u>Reorder Cols</u>.
- You can use the <u>Correlate</u> transform to check sets of random numbers are not correlated. This show the very low correlation between 2 sets of 1,000,000 values between 0.0 and 1.0 generated by **Random** using seeds 0 and 1:

1		Random	Random
	1 Random	1	0.0008029644
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~	2 Random	0.0008029644	1

See also

• <u>Sample</u>

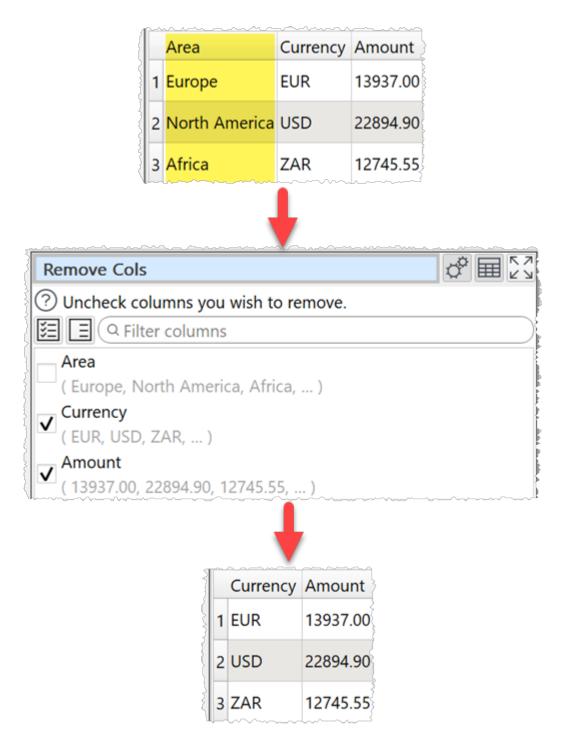

2.3.42 Remove Cols

Description

Removes columns.

Example

Remove the 'Area' column:

One.

Options

• Uncheck the column(s) you wish to remove.

Notes

• The column will be removed from any dataset 'downstream'.

See also

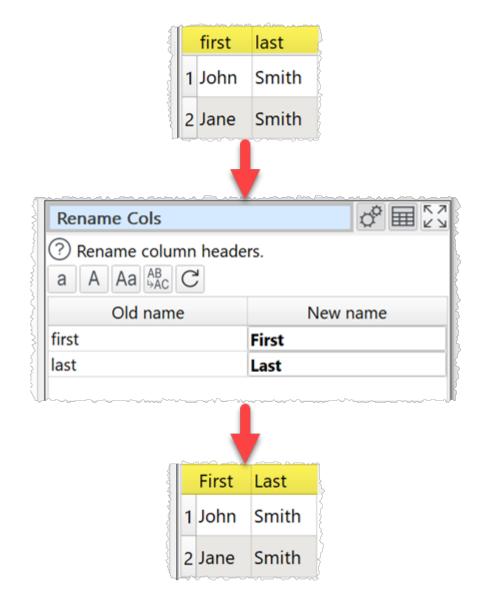

- <u>New Col</u>
- 2.3.43 Rename Cols

Description

Rename column headers.

Example

Rename columns 'first' to 'First' and 'Last' to 'last':

One.

Options

- Change the column headers using the New name column.
- Click the ^a button to change all the names to lower case.
- Click the ^A button to change all the names to upper case.
- Click the ^{Aa} button to change all the names to title case.
- Click the bac button to to replace name text using text, exact text or <u>Regular expression</u> matching.
- Click the deal button to add text to the front or back of all the names.
- Click the not button to add '-2', '-3' etc to duplicate names, to make them unique.
- Click the $\ensuremath{\mathbb{C}}$ button to change all the names back to their original name.
- Click the 🗟 button to copy names to the clipboard.
- Click the 🗟 button to paste from from the clipboard.

Notes

- The names of column headers do not have to be unique.
- Warnings are shown in the Info tab for duplicate column names (case sensitive).
- If you are pasting names, the format expected is comma delimited text. E.g.: name1, name2, name3.

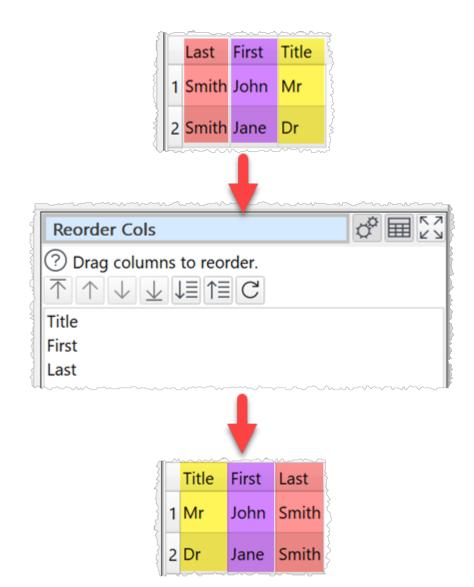

2.3.44 Reorder Cols

Description

Reorder columns.

Example

Reorder 'Last', 'First' and 'Title' columns:

One.

Options

Drag the columns into the desired order (left-most at the top). Click the **Move first** button to move the selected columns to be first. Click the **Move up** button to move the selected columns up one place. Click the **Move down** button to move the selected columns down one place. Click the **Move last** button to move the selected columns to be last. Click the **Sort ascending** button to sort the columns in ascending order. Click the **Sort descending** button to sort the columns in descending order. Click the **Reset** button to restore the original column order.

Notes

- You can also rename columns with <u>Rename Cols</u> and remove unwanted columns with <u>Remove Cols</u>.
- Number, date and text values are treated differently for sorting purposes, when sorting columns.

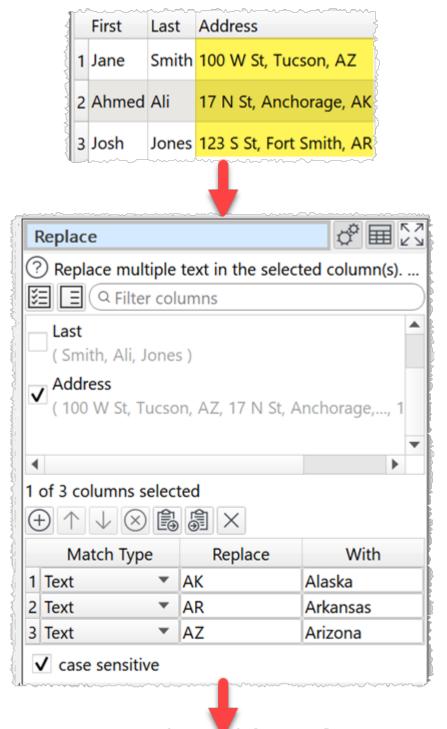

2.3.45 Replace

Description

Replace text in one or more columns.

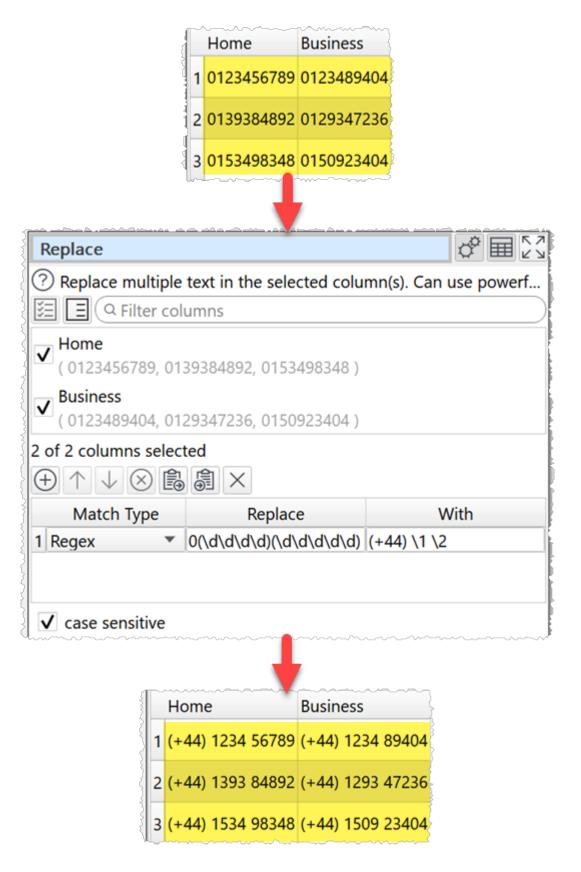

Examples

Replace US state initials in the 'Address' column:

	First	Last	Address		
1	Jane	Smith	100 W St, Tucson, Arizona		
2	Ahmed	Ali	17 N St, Anchorage, Alaska		
3	Josh	Jones	123 S St, Fort Smith, Arkansas		

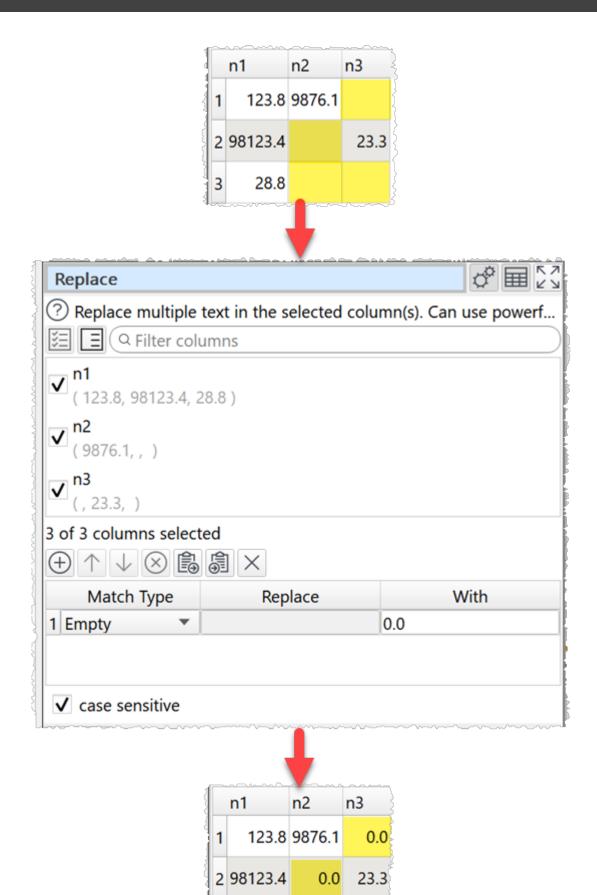

Reformat phone numbers using a regular expression:

Replace a whole word using a regular expression (\b=word boundary):

		company			
	1	<mark>o</mark> lorado	& Co		
		ł			
Replace				of III	¢ 🖩 🕻
? Replace r	nultiple te	ext in the se	lected o	olumn(s	;).
EIQ	Filter colu	mns			
Colorad (o & Co)				
1 of 1 colum	ns selecte	d			
\oplus \uparrow \downarrow	\otimes	\$X			
Match	Гуре	Repla	ce		With
1 Regex	- V	bco\b		Compa	any
case sen	sitive				
	com	pany			
					1

Replace empty values:

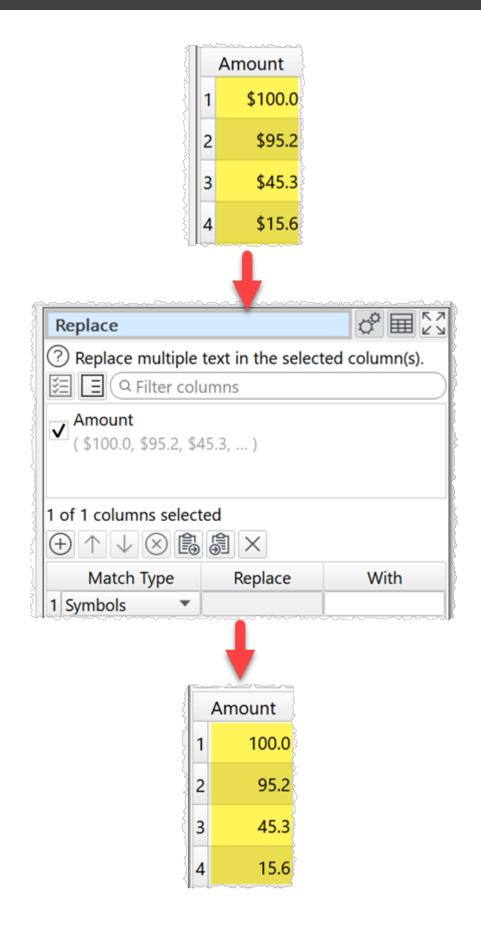

3

28.8

0.0

0.0

Remove symbols:

171

Inputs

One.

Options

- Check the column(s) you wish to transform.
- Click the (\pm) button to add a new filter criteria.
- Click the \uparrow button to move the selected terms up.
- Click the \downarrow button to move the selected terms down.
- Click the \bigotimes button to delete the selected filter terms.
- Click the 🗟 button to copy all terms to the clipboard.
- Click the 🗟 button to paste terms from the clipboard.
- Click the imes button to clear all terms.
- Add the terms you wish to replace and how you wish to replace them.

• Choose the **Match type** as:

- **Text** to replace matches contained in the text.
- Exact text to replace the text only if it matches exactly (whitespace sensitive).
- **Regex** to match using a <u>Regular expression</u>.
- **Empty** to match empty cells (cells with whitespace are not empty). The **Replace** value is ignored.
- Letters to match letters, e.g. 'a'. The Replace value is ignored.
- Digits to match numeric digits, e.g. '1'. The Replace value is ignored.
- Punctuation to match punctuation characters e.g. ','. The Replace value is ignored.
- Symbols to match symbol characters e.g. '\$'. The Replace value is ignored.
- **Space** to match whitespace characters. The **Replace** value is ignored.
- In **Replace** put the text you want to replace for **Text**, **Exact text** or **Regex** matching. You can use a <u>column variable</u>.
- o In With put the text you want to replace it with. You can use a column variable.
- Check **case sensitive** to use case sensitive matching for **Text**, **Exact text** or **Regex** matching.

Notes

- If you can to keep the original column use <u>Copy Cols</u> to copy the column first.
- Comparisons are whitespace sensitive. You can use <u>Whitespace</u> to remove whitespace before replacing.
- If you are pasting in replacement terms, the format expected is comma delimited text with 3 columns.
 - \circ The first column is the 0-based index of the ${\it Match Type}$ drop-down list.
 - \circ The second column is the text $\ensuremath{\textbf{Replace}}.$
 - \circ The third column is the text $\mbox{With}.$

For example, pasting in:

0,YES,1 2,^Y\$,1

Will add:

Match Type		Replace	With	
1	Text		YES	1
2	Regex		^Y\$	1

You can also try copying terms to the clipboard and pasting into a text file to see the format. If you only paste in 1 column of text, it will be assumed to be a list of **Replace**. You can, of course, use Easy Data Transform to create the appropriate filter terms and paste them into memory.

See also

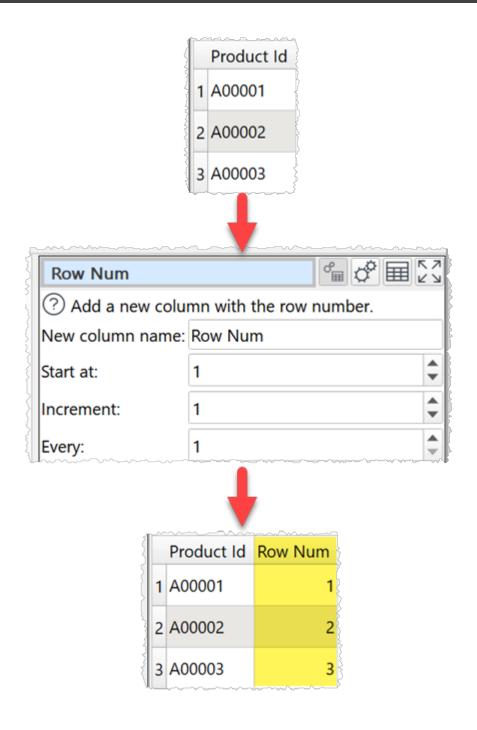

- Insert
- <u>Substitute</u>
- 2.3.46 Row Num

Description

Add a new column that contains the row number.

Example

Add a row number starting at 1:

One.

Options

- Set **New column name** to the name of the new column you want to create.
- Set **Start at** to the number you want to use for the first row.
- Set **Increment** to the amount you wish to increment by.

• set **Every** to how often to apply the increment (e.g. set to 5 to increment once every 5 rows).

Notes

- The new column is added at the right end. You can change the column order with <u>Reorder</u> <u>Cols</u> and the column name with <u>Rename Cols</u>.
- You can <u>Pad</u> the row number with zeros to turn it into a column of unique lds with a fixed length.
- You can use **Row Num** with a <u>Calculate</u> transform using operation **MSecsToDateTime** to create a sequence of dates.
- You can use **Row Num** with <u>Calculate</u> transform using operation **Modulus** and an <u>If</u> transform to create a sequence of repeating text.

2.3.47 Sample

Description

Selects a subset of rows from the input.

Example

Sample 3 rows from 5:

Timestamp	Temperature (F)	Humidity (RH)
1 2020-10-19T20:40	143.5	108
2 2020-10-23T19:45	119.6	127
3 2020-10-27T02:30	101.8	152
4 2020-10-30T16:40	138.5	87
5 2020-11-05T07:15	130.8	132

Sample 🔗 🖽							
⑦ Sample from all rows. Useful for testing changes to d							
Rows:	3						
Select:	Evenly	•					
Random seed:	93267	•					
	disable sampling	2					

	Timestamp	Temperature (F)	Humidity (RH)
1	2020-10-23T19:45	119.6	127
2	2020-10-27T02:30	101.8	152
3	2020-10-30T16:40	138.5	87

L

Inputs

One.

Options

- Set **Rows** to the number of rows you want to output. If it is the same or greater than the number of rows in the input, then the input will be unaffected.
- Set **Select** depending on how you want the rows sampled.
- Check **disable sampling** to turn off sampling. If sampling is disabled, the transform does nothing.

Notes

- If you set **Select** to **Randomly (for quality)** or **Randomly (for speed)**, rows will be selected using a pseudo-random number generator, initialized with **Random seed**. Changing the seed will change the rows sampled.
- With the same **Random seed** and the same **Select** value you should get the same random sampling, even across Windows and Mac versions of Easy Data Transform.
- **Random (for speed)** is significantly faster than **Randomly (for quality)**, but the results may be less random.
- If you are transforming a large dataset, then you can use Sample to test a small subset.
- If you need to do something more complex than Sample can handle (e.g. keep only rows 500 to 1000) then use <u>Slice</u> or <u>Row Num</u> followed by a <u>Filter</u>. For the most complex cases use **Row Num**, followed by <u>Javascript</u>, followed by a **Filter**. E.g. this **Javascript** function returns 1 for every 10th row between 1000 and 2000 and 0 otherwise:

return \$(Row Num) >= 1000 & \$(Row Num) <= 2000 & \$(Row Num) % 10 == 0;

2.3.48 Scale

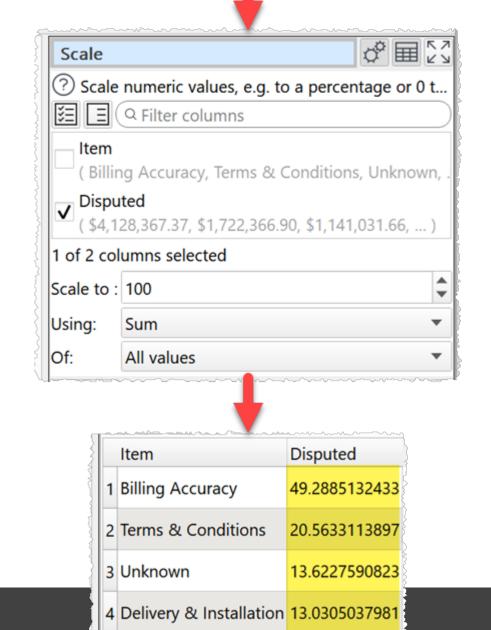

Description

Scale (normalize) numeric values, e.g. to a percentage or 0 to 1.

Examples

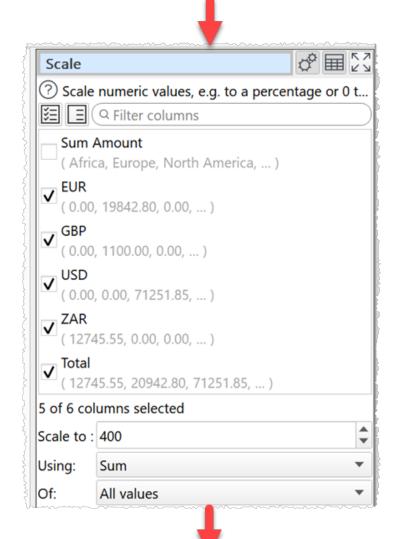

Scale a single column to a percentage:

lte	em	Disputed		
1 Bi	ling Accuracy	\$4,128,367.37		
2 Te	rms & Conditions	\$1,722,366.90		
3 Ur	ıknown	\$1,141,031.66		
4 De	elivery & Installation	\$1,091,424.82		
5 Se	rvice Delivery	\$238,914.81		
6 Te	chnical Issues	\$53,816.33		

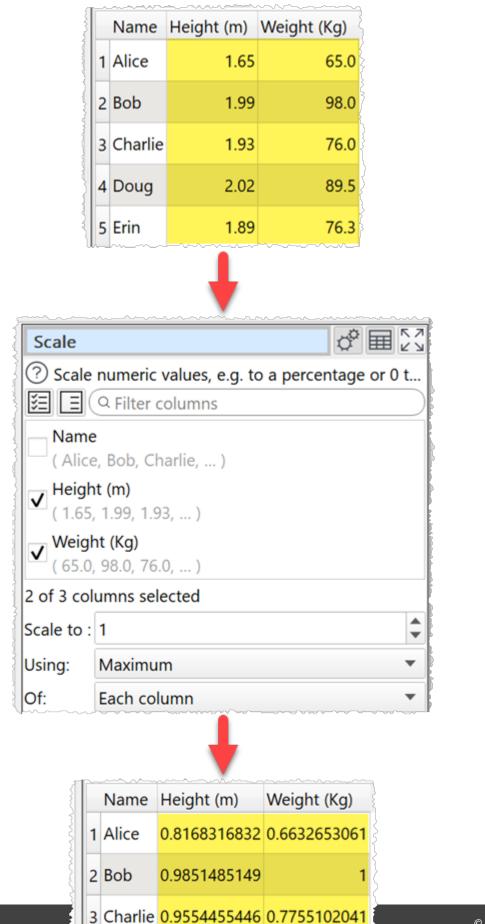

Scale a table with row, column and grand totals to a percentage (scale to 400 as each value is also added to the row total, column total and grand total):

	Sum Amount	EUR	GBP	USD	ZAR	Total
1	Africa	0.00	0.00	0.00	12745.55	12745.55
2	Europe	19842.80	1100.00	0.00	0.00	20942.80
3	North America	0.00	0.00	71251.85	0.00	71251.85
4	Total	19842.80	1100.00	71251.85	12745.55	104940.20

	Sum Amount	EUR	GBP	USD	ZAR	Total
1	Africa	0	0	0	12.1455362197	12.145536219
2	Europe	18.9086737018	1.0482160316	0	0	19.956889733
3	North America	0	0	67.8975740469	0	67.897574046
4	Total	18.9086737018	1.0482160316	67.8975740469	12.1455362197	10

Scale heights and weights so that the largest in each column is 1 and the smallest is 0.

Scale heights and weights so that the largest in each column is 1 and the smallest is 0.

Na	ime	Height (m)	Weight (Kg)			
1 Ali	ice	1.65	65.0			
2 Bo	b	1.99	98.0			
3 Ch	arlie	1.93	76.0			
4 Do	bug	2.02	89.5			
5 Eri	n	1.89	76.3			
Scale Image: Constraint of the second s						
(1.65, Weight (65.0, 9	1.99, 1.9 : (Kg) 98.0, 76					
2 of 3 colu	mns se	ected				
Scale from : 0						
Scale to : 1						
Using:	g: Minimum & Maximum 🔻					
Df: Each column 🔹						

Name	Height (m)	Weight (Kg)
1 Alice	0	0
2 Bob	0.9189189189	1
3 Charlie	0.7567567568	0.33333333333

One.

Options

- Set **Columns** to the columns whose values you want to scale.
- set Scale from to the value you want to scale the minimum value to. E.g. 0 if you want the minimum value scaled to 0. This is only available when Using is set to Minimum and Maximum.
- Set **Scale to** to the value you want to scale the maximum or sum value to. E.g. 100 for a percentage.
- Set **Using** depending on whether you want to use the **Sum**, **Maximum** or **Minimum and Maximum** values for scaling.
- Set **Of** depending on whether you want to scale for **Each column**, **Each row** or for **All values**.

Notes

- Whether values are interpreted as numbers depends on locale.
- Non-numeric values (including empty values) are ignored.
- To replace empty values with zeros use the <u>Replace</u> transform.
- To modify the numerical precision of the results use the Num Format transform.
- To add a '%' at the end of values use the Insert transform.
- To copy columns before using Scale use Copy Cols.
- Warnings are shown in the Warnings tab for non-numeric values.

See also:

<u>Video: How to normalize data</u>

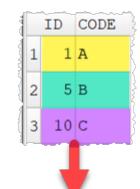

2.3.49 Sequence

Description

Add missing rows from an integer or date sequence.

Examples

Add missing IDs in the current range, with values copied from above:

Sequence		
? Add missing	rows from a sequence.	
Rows added:	Missing integers	Ŧ
From column:	ID	Ŧ
Minimum:	User defined	Ŧ
Minimum value:	1	
Maximum:	User defined	Ŧ
Maximum value:	15	
Order:	Ascending	Ŧ
New values:	Copy from above	Ŧ

Ş		ID	CODE	5
	1	1	A	
	2	2	A	
	3	3	A	
	4	4	A	
	5	5	в	
	6	6	в	
	7	7	в	
North Contraction	8	8	в	
	9	9	в	
	10	10	CODE A A A A A A A B B B B B B B C C C	
	11	11	с	

Add missing dates in a specified range as 0 sales:

	Date	Sales
1	2/1/2023	100
2	7/1/2023	2000
3	9/1/2023	555
ULD-0		

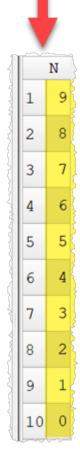

Sequence		
? Add missing	rows from a sequence.	
Rows added:	Missing dates	-
From column:	Date	-
Minimum:	User defined	-
Minimum value:	2023-1-1	
Maximum:	User defined	-
Maximum value:	2023-1-14	
Order:	Ascending	-
New values:	User defined	-
With value:	0	

		Date	Sales
	1	1/1/2023	0
	2	2/1/2023	100
	3	3/1/2023	0
	4	4/1/2023	0
	5	5/1/2023	0
	6	6/1/2023	0
	7	7/1/2023	2000
3	8	8/1/2023	0
	9	9/1/2023	555

Create an integer sequence from a dataset with no rows:

Ν	

	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
Sequence	°∎¢≣∑
? Add missing	rows from a sequence.
Rows added:	Missing integers
From column:	N •
Minimum:	User defined 💌
Minimum value:	0
Maximum:	User defined 💌
Maximum value:	9
Order:	Descending •
New values:	Blank

One.

## **Options**

- Set Rows Added to Missing integers or Missing dates depending on the type of sequence.
- Set From column to the column with the incomplete sequence.
- Set **Minimum** to:
  - **From data** to set the minimum value in the sequence to the minimum value in the selected column.
  - User defined to set the minimum value to a value set by the user. Must be in <u>yyyy-M-d</u> or <u>yyyy-MM-dd</u> format for dates, regardless of the date format in the dataset.
- Set Maximum to:
  - **From data** to set the maximum value in the sequence to the maximum value in the selected column.
  - **User defined** to set the maximum values to a value set by the user. Must be in <u>yyyy-M-d</u> or <u>yyyy-MM-dd</u> format for dates, regardless of the date format in the dataset.
- Set **Order** according to whether you want the dataset sorted **Ascending** or **Descending** by the selected column.
- Set New values to:
  - $\circ$  **Blank** to set new row values to empty.
  - Copy from above to set new row values to the same as the next row sorted above from the input dataset.
  - **Copy from below** to set new row values to the same as the next row sorted below from the input dataset.
  - **User defined** to allow the user to choose a value for new row values. Set **With value** for the new value to use.

#### Notes

- Existing sequence values are unchanged.
- You can add leading zeros to integers values created using the Pad transform.
- Dates added will try to follow the format of existing dates, using the date formats listed in the **Dates** tab of the **Preferences** window. If you want ISO dates, make sure yyyy-MM-dd is above yyyy-M-d.
- You can change the format of dates created using the **DateTime format** transform.
- If you only want to add some values from a sequence (e.g. odd numbers or weekdays) then you can do this by using Sequence followed by <u>Filter</u> to remove the unwanted values. You might need to use <u>Calculate</u> with the **Modulus** and/or **Day of week** operation to create a column to filter on.
- Use the <u>Cross</u> transform if you want to combine multiple sequences. E.g. to cross hourly times (00:00, 01:00 ... 23:00 ) with a date sequence.

# See also

- <u>Video: How to insert missing dates</u>
- <u>New rows</u>
- <u>Fill</u>
- Impute
- Interpolate

#### 2.3.50 Slice

# Description

Keep or remove a continuous section of rows.

# Example

Keep only the rows between the 'YEAR' rows:

	1	2	3	4	
1	YEAR	JAN	FEB	MAR	
2	1980	256.9	238.5	275.4	
3	1981	248.9	224.9	259.1	
4	YEAR	JAN	FEB	MAR	
5	1982	258.6	230.0	280.4	
6	1983	275.9	234.9	251.9	
			~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~		

🥐 Кеер			ovea	contint	1005 30	cuone	100	э.
Mode:	Ke	ер						•
From:	Fir	st ro	ow whe	ere				•
Column:	1							•
Matches:	=	Eq	ual to					•
Value:	YE	AR						
		inc	lude 'F	rom' ro	w			
To:	La	st ro	ow whe	ere				•
Column:	1							•
Matches:	=	Eq	ual to					•
Value:	YE	YEAR						
		inc	lude 'T	o' row				
✓ case sensitive								
		~~~						~~~~~
		3	1	2	3	4		

One.

## **Options**

- Set **Mode** depending on whether you want to keep or remove the slice.
- Set **From** according to how you want to choose the first row of the slice.
- Set **Column**, **Matches** and **Value** to match the first row. You can use a <u>column variable</u> for either **Value**.
- Uncheck Include 'From' row if you don't want to include the first row in the slice.
- Set **To** according to how you want to choose the last row of the slice.
- Set Column, Matches and Value to match the last row.
- Uncheck Include 'To' row if you don't want to include the last row in the slice.
- Check case sensitive to use case sensitive matching for text.

## Notes

- If there is no match for the From or To row:
  - Mode=Keep will remove all rows
  - Mode=Remove will keep all rows
- <u>Number</u>, <u>date</u> and <u>text</u> values are treated differently for **Equal to**, **Greater than**, **Less than**, **Greater than equal**, **Less than equal** and **Not equal to** operations.
  - If both values are numeric, a numeric comparison will be carried out. This is accurate to approximately 16 digits of precision.
  - If both values match a supported date formats in <u>Preferences</u>, a date comparison will be carried out.
  - $\ensuremath{\circ}$  Otherwise the values will be treated as text.
  - For example, an empty value is considered less than 0, because they will be compared as text. So you might want to <u>replace empty values with 0</u> or remove those rows with <u>Filter</u>, before comparing them.
- All values are treated as text for Contains, Starts with, Ends with, Matches regex, Is not, Doesn't start with, Doesn't end with and Doesn't match regex operations.
- Comparisons of text are whitespace sensitive. Cells with whitespace will not match Is
  empty. You can use <u>Whitespace</u> to remove whitespace before filtering and <u>Replace</u> to get
  of other unwanted characters (e.g. whitespace inside the text).
- See here for more details on <u>Regular expressions</u> (regex).
- If you want to keep or remove a selection of rows by row number, use a <u>Row Num</u> transform followed by a <u>Filter</u> transform.

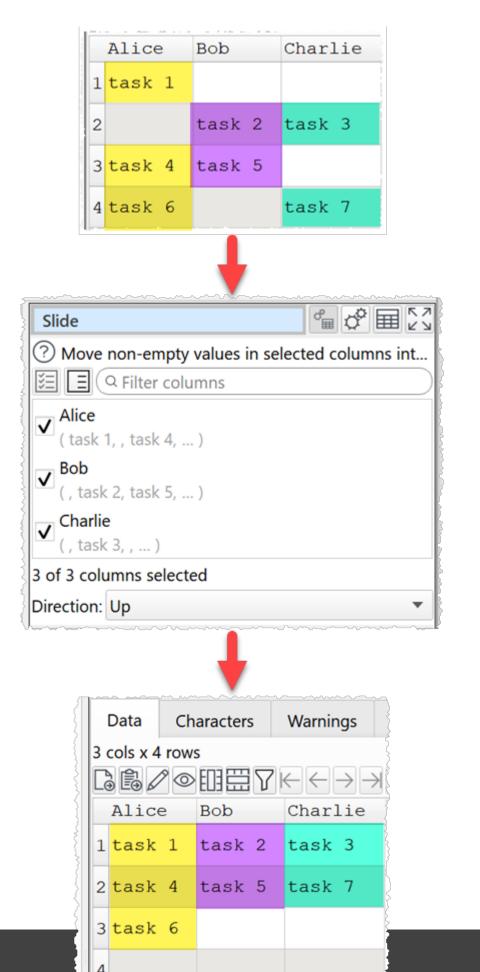

#### 2.3.51 Slide

# Description

Move non-empty values in selected columns to adjacent non-empty cells.

# Example

Move all non-empty values to the top:

Easy Data Transform

One.

# Options

- Check the column(s) you wish to move values in.
- Select **Direction** depending on the direction you wish to move values.

## Notes

- Cells containing whitespace are not considered empty.
- You can delete rows left empty using Filter. and column left empty using Remove Cols.

## See also

- Offset
- <u>Fill</u>
- Whitespace

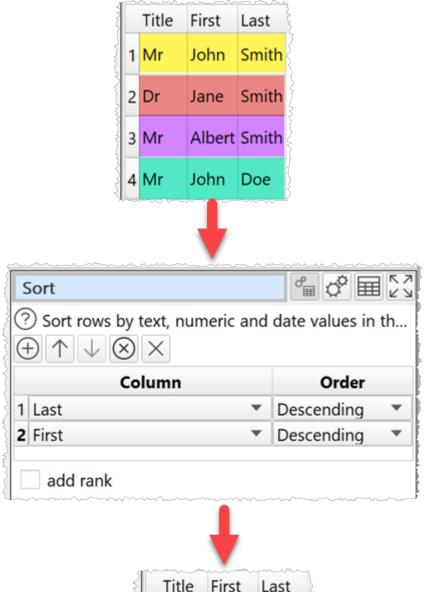

#### 2.3.52 Sort

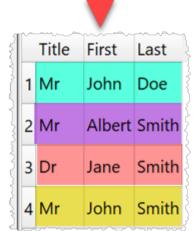

## Description

Sorts rows by one or more columns.

# **Examples**

Sort by 'Last' and then First' columns:

Sort by 'Category' and then 'Score' columns. Rank for each distinct 'Category' value:

	Name	Category	Score
1	Andy	Novice	122
2	Bill	Veteran	120
3	Charles	Novice	123
<b>4</b>	Dennis	Veteran	131
5	Eric	Veteran	120
6	Fred	Veteran	123
	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~		

Sort			° 🖬 🗘 🏛	
	ws by text, numer $\downarrow \otimes imes$	ric and	date values in t	h
	Column		Order	
1 Catego	у	•	Descending	۳
2 Score		•	Descending	▼
Rank type:	✓ add rank Minimum			•
Rank by:	Category			Ŧ

2		Name	Category	Score	Rank
	1	Dennis	Veteran	131	1
	2	Fred	Veteran	123	2
2	3	Bill	Veteran	120	3
	4	Eric	Veteran	120	3
	5	Charles	Novice	123	1

Easy Data Transform

One.

Options

- Click the \oplus button to add a new sort level.
- Click the \uparrow button to move the selected sort levels up.
- Click the ψ button to move the selected sort levels down.
- Click the \otimes button to delete the selected sort level(s).
- Click the imes button to clear all sort levels.
- Set **Column** to the column you want to sort by.
- Set Order depending on whether you want to sort this column Ascending or Descending.
- Check add rank to add a ranking column
 - o Set Rank type according to how you wish to do the ranking:
 - Minimum: Uses the minimum rank of each group.
 - Average: Uses the average rank of each group.
 - Maximum: Uses the maximum rank of each group.
 - Dense: Each successive rank is only incremented by 1. There are no gaps.
 - **Cumulative**: Shows the proportion of rows (0 to 1) with the same or lower numbered rank.

For example:

	Sorted	score
1		131
2		123
3		123
4		123
5		120
6		120

Gives the following rankings, depending on Rank type:

	Rank type								
Sorted score	Minimum	Average	Maximum	Dense	Cumulative				
131	1	1	1	1	0.167				
123	2	3	4	2	0.667				
123	2	3	4	2	0.667				
123	2	3	4	2	0.667				
120	5	5.5	6	3	1				
120	5	5.5	6	3	1				

 Set Rank by to rank separately for each distinct value in this column. Leave as <None selected> if you only want a single ranking for all rows.

Notes

- If you add multiple levels, it will sort by level 1 then level 1 values that are the same will be sorted by level 2 etc.
- Number, date and text values are treated differently for sorting purposes.
- Any values that can be converted to numbers will be treated as numbers.
- Any values that match the supported date formats in <u>Preferences</u> will be treated as dates.
- Comparisons of text are case and whitespace sensitive. You can use <u>Case</u> to change the case and <u>Whitespace</u> to remove whitespace before sorting.
- If you want to rank rows without losing the original order, use <u>Row Num</u> to add a row number before the **Sort**, and then use another **Sort** on the **Row Num** column to return to the original order.
- Unsorted columns can be sorted into any order and this may vary between different released of Easy Data Transform and Windows and Mac versions.

See also:

• Video: How to rank data

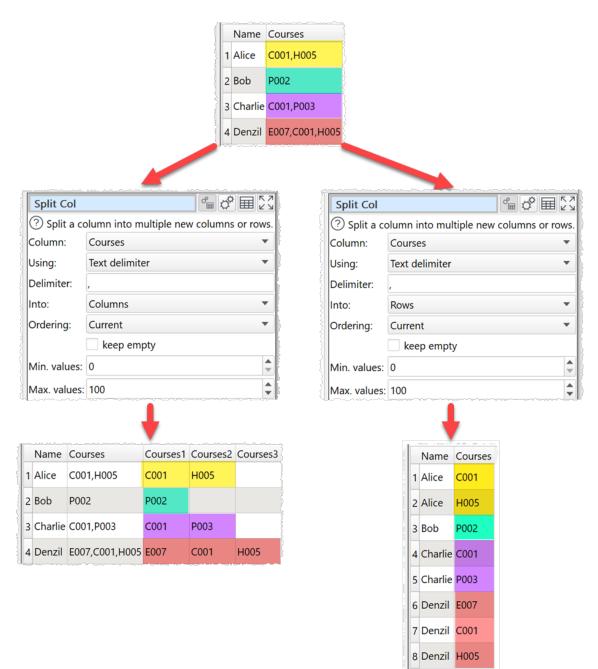

2.3.53 Split Col

Description

Split a column into multiple new columns or rows.

Examples

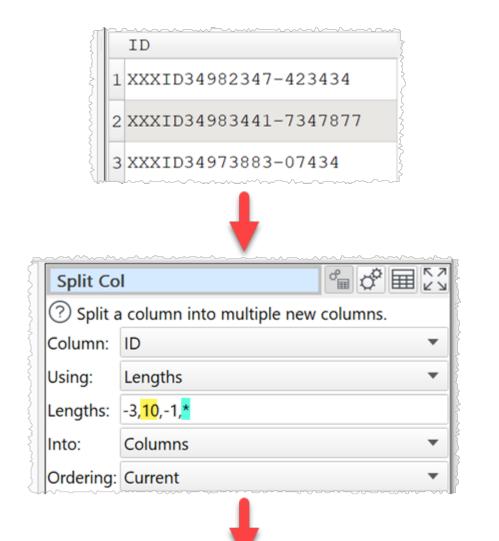

Split the 'Courses' column into multiple columns or rows:

Split the 'URL' column into multiple columns using colon, slash, question mark or ampersand:

URL	URL						
1 https://v	vww.eas	ydatat	ransform.com/index.ht	ml?utm=adword	s&token=xxx		
2 https://	vww.per	fecttab	leplan.com/download.	html			
3 https://	vww.hyp	erplan	.com/buy.html?utm=tv	vitter			
			ŧ				
	Spli	t Col		° de			
	? s	plit a co	olumn into multiple new	columns or rows.			
	Colur	nn:	Courses	•			
	Using	J:	Regex delimiter	•			
	Delim	niter:	[:/?&J]				
	Into:		Columns	•			
	Order	ring:	Current	•			
			keep empty				
	Min.	values:	0	•			
	Max.	values:	100	\$	3		
	Phane -	~~~~ <u>~</u> ~		~~~~~~~~~~~~~~~~			
L	URL1	URL2		URL3	URL4	URL5	
ps://www.easydatatransf.	. https	www.	easydatatransform.co	. index.html	utm=adwords	token=xxx	
s://www.perfecttablepl	https	www.	perfecttableplan.com	download.html			
os://www.hyperplan.co	https	www.	hyperplan.com	buy.html	utm=twitter		
www.perfecttablepl	https . https	www. www.	perfecttableplan.com	. <mark>index.html</mark> download.html	utm=adwords		

Split characters 4 to 13 and 15 onward into new columns:

	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~	m.
ID	ID1	ID2
1 XXXID34982347-423434	ID34982347	423434
2 XXXID34983441-7347877	ID34983441	7347877
3 XXXID34973883-07434	ID34973883	07434

One.

# Options

• Select the **Column** you wish to split.

- Set **Using** depending on whether you wish to split using a **Text delimiter** (usually a single character), a **Regex delimiter** or **Lengths** of each column.
- Set the **Delimiter** for splitting the column. E.g., (comma). For **Text delimiter** or **Regex delimiter** only.
- Set **Lengths** as a comma separated list of the number of characters in each new column. Put - in front of a value to ignore it. Use * as a wildcard to mean 'the rest of the value'. Only 1 * can be used. For **Lengths** only. For example:
  - o 3, 5, 4 will create 3 columns with characters 1-3, 4-8 and 8-11
  - $\circ$  -3, 5, -4, * will create 2 columns with characters 4-8 and 12 onward
  - $\circ$  –* , 3 will create 1 column with the last 3 characters
  - $\circ$  2 , -* , 2 will create 2 columns with the first 2 and last 2 characters
- Set Into to:
  - $\circ$  **Columns** to create a new column for each split value.
  - $\circ$  **Rows** to create a new row for each split value (the original row is removed).
- Set Ordering depending on how you want to order values after splitting.
- Check **keep empty** if you wish to keep empty values (e.g. honor delimiters with nothing in between). For **Text delimiter** or **Regex delimiter** only.
- set **Min. values** to the minimum number of columns/rows you wish to split each value into. For **Text delimiter** or **Regex delimiter** only.
- set **Max. values** to the maximum number of columns/rows you wish to split each value into (ignored if less than minimum). For **Text delimiter** or **Regex delimiter** only.

## Notes

- Set Min. values to the same as Max. values to always create the same number of columns.
- To split a column by carriage returns or tabs set **Using** to **Regex delimiter** and set **Delimiter** to \n or \t, respectively.
- If **Into** is **Columns**, new columns are added at the right end. You can change the column order with <u>Reorder Cols</u>.
- If there is a header, the header of the new column is based on the original header. You can change the column name with <u>Rename Cols</u>.
- The opposite of Split Col with Into as Columns is Concat Cols.
- The opposite of **Split Col** with **Into** as **Rows** is <u>Unique</u>.

## See also

• Split Rows

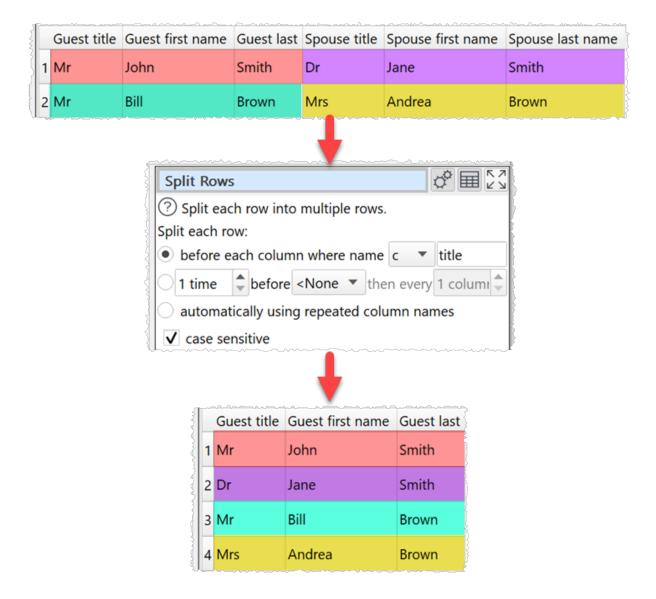

#### 2.3.54 Split Rows

## Description

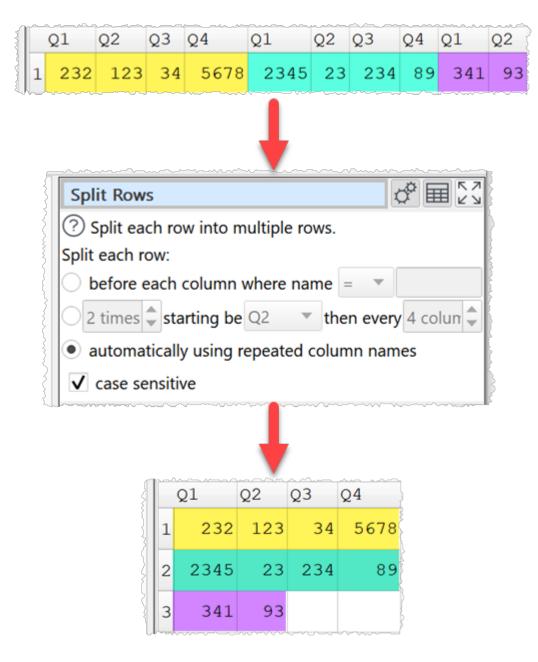

Split each row into multiple rows.

## **Examples**

Split rows before each column containing 'title':

Split rows using repeated column names:

One.

# Options

- Split by column name:
  - $_{\odot}$  Each row will be split before each column that matches the criteria.
- Split a fixed number of times:
  - Define the number of times you want to split each row, starting before which column and then every N columns.
  - $\ensuremath{\circ}$  The split is added before the designated columns.

- Splits after the last column are ignored. So you can set **times** to a large number if you don't know how many columns there will be.
- Split automatically:
  - $\circ$  Find the first column name that appears more than once and split each row before each column with that name.
- Check **case sensitive** to use case sensitive matching for column names.

## Notes

- Comparisons of column names are whitespace sensitive.
- Splits added before the first column are ignored, as there is already a split there.
- Use <u>New Col</u> or <u>Rename Cols</u> if you need to add additional columns or rename columns before splitting rows.
- The opposite of **Split Rows** is <u>Concat Rows</u>.

# See also

- <u>Gather</u>
- Split Col

#### 2.3.55 Spread

## Description

Spread a column into multiple new columns. Also called wide pivot or crosstab.

# Example

Spread 'Quarter' and 'Amount' columns to multiple columns:

area	Quarter	Value
North	Q1	11.3
North	Q2	89.3
North	Q3	44.3
North	Q4	18
East	Q1	4.5
East	Q2	7.9
East	Q3	8
East	Q4	3.3
	East	East Q4

Spread	8 II 🖓
⑦ Spread the	selected key and value columns into m
Key column:	Quarter 🔹
Value column:	Value •
Missing value:	
Min. new cols:	0
Max. new cols:	100

	salesman	area	Q1	Q2	Q3	Q4
1	Alice	North	11.3	89.3	44.3	18
2	Bob	East	4.5	7.9	8	3.3

One.

# Options

- Select the Key column and Value column you wish to spread.
- Missing values is used for values missing from the input dataset.
- set **Min. new cols** to the minimum number of new columns you wish to add, compared to the original dataset.
- set **Max. new cols** to the maximum number of new columns you wish to add, compared to the original dataset. Ignored if less than minimum.

## Notes

- Set Min. values to the same as Max. values to always create the same number of columns.
- Use <u>Sort</u> on the key column before this transform if you need to control the order of columns created.
- If there are rows that are duplicates, apart from the value column, this will cause errors.
- New columns are added at the right end. You can change the column order with <u>Reorder</u> <u>Cols</u>.
- You can merge the new columns into a single column with Concat Cols.
- The opposite of Spread is Gather.

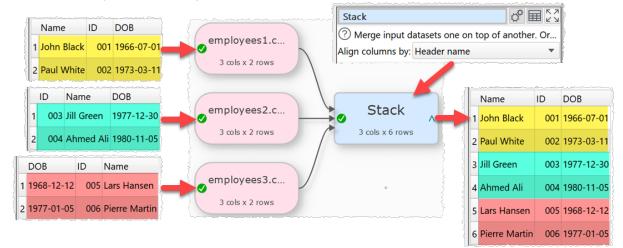

#### 2.3.56 Stack

## Description

Merge rows from inputs, one on top of the other.

## **Examples**

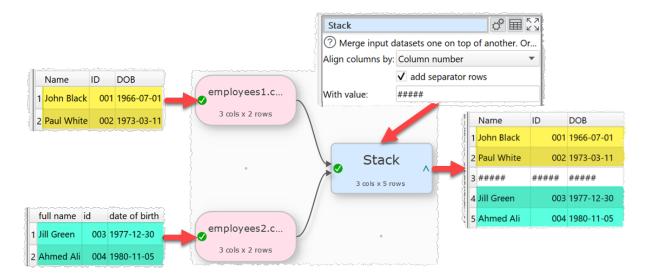

Stack 3 employee datasets by header name:

Stack 2 employee datasets by column number:

									ALVEN ALVEN	
					Stac	k		¢ 🖩		
Name	ID	DOB	1		? M	erge input datas	ets one on to	op of another.	Or	
1 John Black	001	1966-07-01		employees1.c	Align	columns by: Colu	umn number		•	
2 Paul White	002	1973-03-11		3 cols x 2 rows				Name	ID	DOB
								1 John Black	001	1966-07-0
						Stack		2 Paul White	002	1973-03-1
						3 cols x 4 rows		3 Jill Green	003	1977-12-3
full name id	l d	late of birth	~		/		~	4 Ahmed Ali		1980-11-0
Jill Green	003 1	977-12-30		employees2.c			and			
Ahmed Ali	004 1	980-11-05		3 cols x 2 rows						

Stack 2 employee datasets with a separator row:

# Inputs

One or more.

# Options

- Select **Align columns by** to **Header name** if you want line up column values by header name (e.g. the 'id' column in input 1 with the 'id' column in input 2) and **Column number** to align by the column number (e.g. the first column of input 1 with the first column of input 2). The headers will be matched in order:
  - o case and whitespace sensitive (e.g. 'ID' to 'ID'); then
  - o case insensitive and whitespace sensitive (e.g. 'Id' to 'ID'); then
  - $\circ$  case sensitive and whitespace insensitive (e.g. 'ID' to ' ID '); then

- $\circ$  case and whitespace insensitive (e.g. 'Id' to ' ID ')
- Check use only top dataset columns to ignore columns not in the first dataset.
- Check **add separator rows** to extra rows to separate the inputs. The value entered for **With value** is used for each column of the separator rows.

#### Notes

- The stacking order depends on the vertical (Y-axis) position of the inputs.
- Stack merges datasets one on top of the other (vertically). To merge datasets side-by-side (horizontally) use <u>Join</u>.
- If you align by **Column number** the header of the first input is used.
- Messages are shown in the Warnings tab for:
   o duplicated column names within an input dataset when Align columns by is set to
  - Header name
  - columns stacked under columns with different names when Align columns by is set to Column number
  - $\circ$  differing numbers of columns between input datasets
- It is sometimes useful to **Stack** a single dataset, so you can add more inputs later.

# See also

- <u>Cross</u>
- <u>Join</u>
- Merge datasets

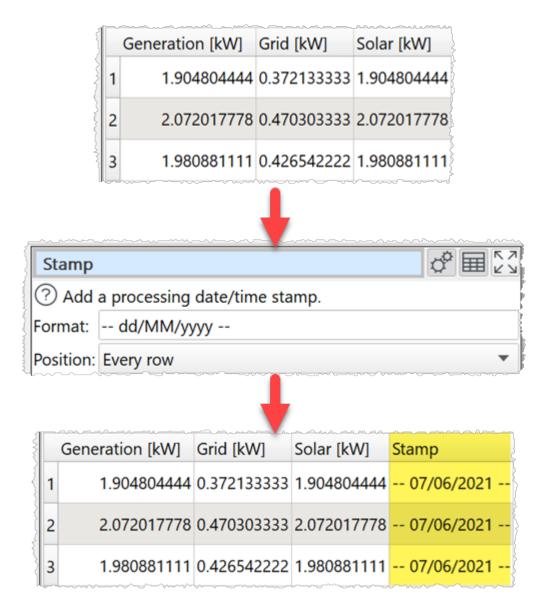

#### 2.3.57 Stamp

## Description

Adds a stamp with time, date and other information as a new row or a new column.

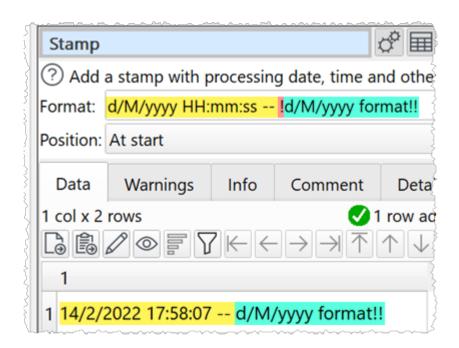

# Examples

Add the current date to the end of each row:

Add the current date and time to the top of a dataset with a comment:

One.

## **Options**

• Supply the stamp format in **Format** (see below).

Format	Meaning
d	The day as number without a leading zero (1 to 31)
dd	The day as number with a leading zero (01 to 31)
ddd	The abbreviated localized day name (e.g. 'Mon' to 'Sun'). Uses the <u>locale</u> to localize the name.
dddd	The long localized day name (e.g. 'Monday' to 'Sunday'). Uses the <u>locale</u> to localize the name.
М	The month as number without a leading zero (1 to 12).
MM	The month as number with a leading zero (01 to 12)

Format	Meaning
MMM	The abbreviated localized month name (e.g. 'Jan' to 'Dec'). Uses the <u>locale</u> to localize the name.
MMMM	The long localized month name (e.g. 'January' to 'December'). Uses the <u>locale</u> to localize the name.
УУ	The year as two digit number (00 to 99).
УЛЛЛ	The year as four digit number. If the year is negative, a minus sign is prepended in addition.
h	The hour without a leading zero (0 to 23 or 1 to 12 if AM/PM display).
hh	The hour with a leading zero (00 to 23 or 01 to 12 if AM/PM display).
Н	The hour without a leading zero (0 to 23, even with AM/PM display).
НН	The hour with a leading zero (00 to 23, even with AM/PM display).
m	The minute without a leading zero (0 to 59).
mm	The minute with a leading zero (00 to 59).
S	The whole second without a leading zero (0 to 59).
SS	The whole second with a leading zero where applicable (00 to 59).
Z	The fractional part of the second, to go after a decimal point, without trailing zeroes (0 to 999). Thus "s.z" reports the seconds to full available (millisecond) precision without trailing zeroes.
AP or A	The fractional part of the second, to millisecond precision, including trailing.

Format	Meaning
ap or a	Use am/pm display. a/ap will be replaced by either "am" or "pm".
t	The timezone (for example "CEST").
\$(c)	The computer name.
\$(f)	The path of the .transform file, e.g. /Users/andy/Desktop/mytransfor m.transform.
\$ (u)	The name of the user (from the USER or USERNAME environment variable).
!	Anything after the first ! (exclamation) character won't be substituted.

• Select from **Position** whether you want the stamp row added to the start or end of the dataset or to every row in a new column.

#### Notes

- If you add the stamp to Every Row you can move the column using Reorder Cols.
- The **Format** text is case sensitive.

#### See also

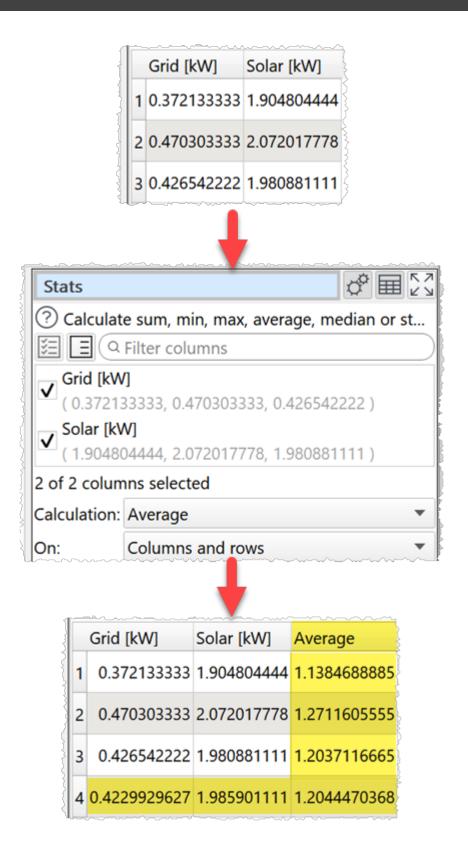

- <u>Meta information</u>
- <u>Stack</u>
- 2.3.58 Stats

## Description

Calculates statistics by column and/or row in one or more selected columns.

## Example

Calculate column and row averages:

#### Inputs One.

# Options

- Check the column(s) you wish to calculate stats for.
- Set Calculation to the statistic you want to calculate:
  - $\circ$  Sum show the sum of the values.
  - Minimum shows the smallest value.
  - Maximum shows the largest value.
  - o Average shows the arithmetic mean of the values.
  - o Median shows the median of numeric values in the column.
  - $\circ$  **Mode** shows the mode of numeric values in the column.
  - **Standard deviation** is the sample standard deviation (equivalent to Excel function stddev.s).
  - Variance is the square of the sample standard deviation.
  - $\circ$  **Q1** is the first quartile (calculated using Method 1 <u>here</u>).
  - Q3 is the third quartile (calculated using Method 1 here).
  - o **IQR** is the Inter Quartile Range.
  - Skew is the alternative Pearson Mode Skewness (3 * (Mean Median) / Standard Deviation ).
  - **Percentile (inclusive)** is an interpolated value at which the specified **Percentile** of values are below or equal to this value. It is similar to the Excel PERCENTILE.INC() function.
  - **Percentile (exclusive)** is an interpolated value at which the specified **Percentile** of values are below this value. It is similar to the Excel PERCENTILE.EXC() function.
- **Percentile** is the percentile value to use in **Percentile (inclusive)** and **Percentile (exclusive)** calculation.
- Set **On** depending on whether you wish to calculate the statistics for columns, rows or both.
  - $\circ$  If On is set to Columns an extra row with the results is added to the bottom.
  - $\circ$  If **On** is set to **Rows** an extra column with the results is added to the right.
  - If On is set to Columns and rows an extra row with the results is added to the bottom and extra column with the results is added to the right. The bottom right cell contains the calculation across all values.

#### Notes

- Non-numerical and empty values are ignored.
- **Mode** may not work as expected with non-integer values, due to precision issues. You can fix this by using a <u>Num Format</u> transform first.
- Use <u>Num Format</u> to change the precision of the results.
- Use <u>Scale</u> to convert the results to percentages.
- If you want to compute the sum, minimum, maximum or average for each distinct value in 1 or more columns you can use <u>Unique</u>.

#### See also

<u>Correlate</u>

- <u>Count</u>
- <u>Pivot</u>
- <u>Summary</u>

2.3.59 Substitute

## Description

Substitute column values into text.

## Example

Create an SQL statement to insert 'date', 'cases', 'deaths' and 'country' values into 'mytable':

					- 1 -	date	cases	ueatris	country	
					1	2020-05-03	134	4	Afghanistan	
					2	2020-05-03	7	0	Albania	
					3	2020-05-03	141	6	Algeria	
					U-			imin		
~~	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~	~~~	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~						······	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
•	Substitute									\$ ■ 2
C	Substitute	colum	nn value	s into text.						
N	ew column ı	name:	SQL							
	ubstitution s	cript:								
Sı		•	able (	country,da	te,de	aths,cases	s) VAI	UES (\$	\$(country);	<pre>\$(date),\$(deaths),\$(cases));</pre>
Sı		•	able (	country,da	te,de	aths,cases	s) VAI	.UES (\$	\$(country);	<pre>\$(date),\$(deaths),\$(cases));</pre>
Sı		•	able (	country,da	te,de	aths, case:	s) VAI	UES (\$	\$(country);	<pre>\$(date),\$(deaths),\$(cases));</pre>
I		0 myt	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~		te, de	aths, cases	s) VAI	LUES (\$	\$(country);	<pre>\$(date),\$(deaths),\$(cases));</pre>
SI I	NSERT INT	0 myt	deaths	country	SQL					\$(date),\$(deaths),\$(cases)); ses) VALUES (Afghanistan,2020-05-03,4,134)
Su I 1	NSERT INT	O myt	deaths 4	country Afghanistan	SQL	T INTO myta	able (cc	puntry,d	ate, deaths, ca	

#### Inputs

One.

# Options

- Set New column name to the name of the new column you want to create.
- Enter your substitution script into the Substitution script field.
- Select a column from **Insert variable** to add that <u>column variable</u> into the **Substitution script** field at the current cursor position.
- Click the **Evaluate** button to evaluate your script over every row and show any errors (only available if **Run>Auto Run** is checked).

#### Notes

- The new column is added at the right end. You can change the column order with <u>Reorder</u> <u>Cols</u> and the column name with <u>Rename Cols</u>.
- If you want to carry out your transform across more than one dataset, you should <u>Join</u> them first.
- If you need to do something more complex than this transform allows, try the <u>Javascript</u> transform.
- Warnings are shown in the **Warnings** tab for ambiguous column references.

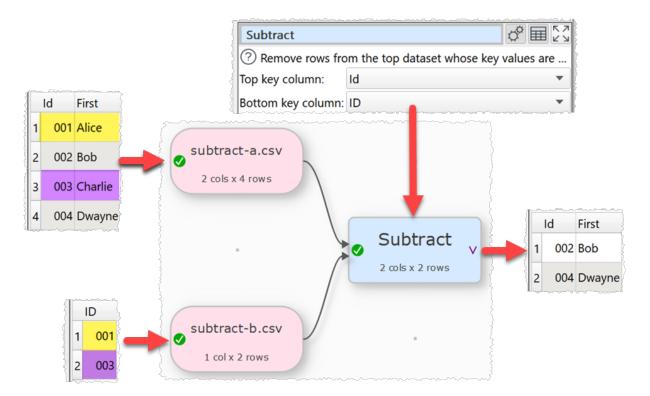

2.3.60 Subtract

# Description

Remove rows from the top dataset with key values that are present in the lower dataset.

# Example

Subtract from the top dataset all the rows with IDs in the bottom dataset:

## Inputs

Two.

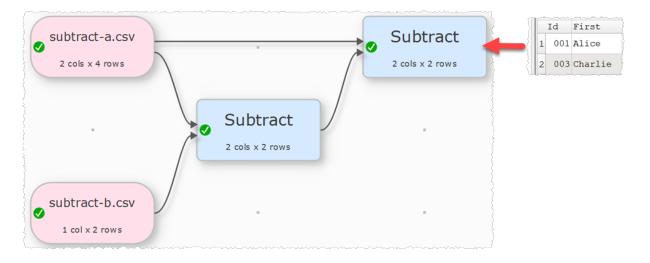

# Options

- The output depends on the vertical (Y-axis) position of the inputs.
- Click Explore Keys... to compare key values in the 2 datasets.

- Select **Top key column** for the column you want to match in the top input dataset.
- Select **Bottom key column** for the column you want to match in the bottom input dataset.
- Check case sensitive to use case sensitive matching for keys.

#### Notes

- This transform is sometimes called an anti-join.
- If there are 10k rows or less in both datasets, Easy Data Transform will try to guess sensible default values for **Top key column** and **Bottom key column** based on column header names and contents.
- If the first input has a header, this will be used for the output.
- All values are treated as text and comparisons are whitespace sensitive. You can use <u>Whitespace</u> to remove whitespace before the subtract.
- <u>All</u> rows in the top dataset with a given key value are removed if that key value occurs 1 or more times in the bottom dataset.
- You can use <u>Concat Cols</u> to join several columns together (e.g. 'first name' and 'last name' columns) to form a key column.
- You can use Row Num to create a unique key column.
- Use a second **Subtract** transform to see what was subtracted:

## See also

- Intersect
- 2.3.61 Summary

## Description

Summarize the values in the selected columns.

## Example

Create a summary, including dates and statistics:

Ş	<b>`</b>	date	cases	deaths	country	
	1	2020-05-03	134	4	Afghanistan	
	2	2020-05-03	7	0	Albania	
	3	2020-05-03	141	6	Algeria	
1	10 have	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~	·····	·	function of the second of the	
	~~	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~			~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~

2	Non-empty values	3	3	3	3
3	Numeric values	0	3	3	0
4	Integer values	0	3	3	0
5	Date values	3	0	0	0
6	Text values	0	0	0	3
7	Distinct values	1	3	3	3
8	Unique values	0	3	3	3
9	Duplicated values	1	0	0	0
10	Min length	10	1	1	7

Easy Data Transfor

vx Digital Ltd

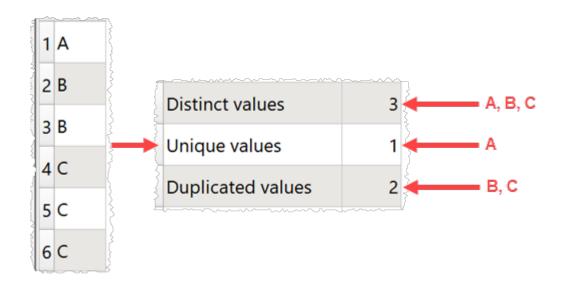

One.

Options

- Select the **Columns** you wish to summarize.
- Check **include dates** if you wish to check for date values using <u>supported date formats</u>. This can be <u>slow</u> for large datasets.
- Check **include statistics** if you wish to add the sum, average, median and standard deviation for numeric values.

Notes

- Whether values are interpreted as number or dates depends on **Supported date formats** and <u>locale</u>.
- **Empty values** is the number of values in the column that are completely empty. Values with whitespace do not count as empty.
- **Non-empty values** is the number of values in the column that are not completely empty. Values with whitespace do not count as empty.
- **Numeric values** is the number of numeric of values in the column that can be interpreted as a number.
- **Integer values** is the number of numeric of values in the column that can be interpreted as integers (whole numbers). "1.0" (depending on your <u>locale</u>), "0", "-1" and "1e3" are considered integers.
- **Real values** is the number of numeric values in the column that can be interpreted as reals (floating point numbers). "1.2345" (depending on your <u>locale</u>) and "1e-3" are considered reals.
- **Boolean values** is the number of values in the column that can be interpreted as booleans (true/false). "TRUE", "True" and "false" are considered booleans.
- **Date values** is the number of values in the column that can be interpreted as a date. Only shown if **check for dates** is checked.
- **Text values** is the number of values in the column that cannot be interpreted as empty, numeric or date.
- **Distinct values** is the number of different values in the column. Date and numeric values are treated as text (e.g. '7' is treated as different to '7.0' and '1/1/2020' is treated as different to '01/01/2020'). Comparison between values is sensitive to case and whitespace.
- **Unique values** is the number of values that only occur once in the column. Date and numeric values are treated as text. Comparison between values is sensitive to case and whitespace.
- **Duplicated values** is the number of values that occur more than once in the column. Date and numeric values are treated as text. Comparison between values is sensitive to case and whitespace.

- **Min length** is the minimum number of characters of non-empty values in the column. Whitespace is counted. Date and numeric values are treated as text.
- **Max length** is the maximum number of characters of values in the column. Whitespace is counted. Date and numeric values are treated as text.
- **Average length** is the arithmetic mean of the number of characters of non-empty values in the column. Whitespace is counted. Date and numeric values are treated as text.
- **Min numeric** is the minimum numeric value in the column. Non-numeric and empty values are ignored.
- **Max numeric** is the maximum numeric value in the column. Non-numeric and empty values are ignored.
- Range numeric is Max numeric Min numeric.
- **Negative numeric** is the number of negative numeric values in the column. 0 is not considered negative here.
- Zero numeric is the number of numeric zero values in the column.
- **Positive numeric** is the number of positive numeric values in the column. 0 is not considered positive here.
- **Sum numeric** is the sum of numeric values in the column. Non-numeric and empty values are ignored. Only shown if **include statistics** is checked.
- **Average numeric** is the arithmetic mean of numeric values in the column. Non-numeric and empty values are ignored. Only shown if **include statistics** is checked.
- **Median numeric** is the median of numeric values in the column. Non-numeric and empty values are ignored. Only shown if **include statistics** is checked.
- **Mode numeric** is the mode of numeric values in the column. Non-numeric and empty values are ignored. Only shown if **include statistics** is checked.
- **Stddev numeric** is the sample standard deviation (equivalent to Excel function stddev.s) of numeric values in the column. Non-numeric and empty values are ignored. Only shown if **include statistics** is checked.
- Variance numeric is the square of the sample standard deviation. Only shown if include statistics is checked.

- **Q1 numeric** is the first quartile (calculated using Method 1 <u>here</u>). Only shown if **include statistics** is checked.
- Q3 numeric is the third quartile (calculated using Method 1 <u>here</u>). Only shown if **include statistics** is checked.
- **IQR numeric** is the Inter Quartile Range. Only shown if **include statistics** is checked.
- **Skew numeric** is the alternative Pearson Mode Skewness (3 * (Mean Median) / Standard Deviation). Only shown if **include statistics** is checked.
- **Min date** is the minimum date value in the column. Only shown if **include dates** is checked.
- Max date is the maximum date value in the column. Only shown if **include dates** is checked.
- **Most frequent** lists the most common text in the column. Empty values are not counted. Date and numeric values are treated as text. Comparison between values is sensitive to case and whitespace.

Notes

- If your dataset is large, you might want to <u>Sample</u> it first.
- Use Num Format to change the precision of numerical results.
- You can use <u>Whitespace</u> to remove any whitespace at the start or end of values before **Summary**.
- If you wish to have a row displayed per column you can <u>Transpose</u> the table first.
- **Mode** may not work as expected with non-integer values, due to precision issues. You can fix this by using a <u>Num Format</u> transform first.

See also

- <u>Correlate</u>
- <u>Count</u>
- <u>Ngram</u>
- <u>Pivot</u>
- <u>Stats</u>

2.3.62 Total

Description

Add a new column with a running (cumulative) total of the selected column.

Examples

Total the 'transaction' column:

	area	transaction
1	North	100
2	2 South	200
3	8 North	-50
4	1 South	320
5	5 East	200
e	5 East	-50
_	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~	

Total		¢ ⊞ ∑
? Add	a new column with a	running (cumulative) t
Column:	transaction	•
By:	<none selected=""></none>	

Ŧ

<u>_</u>		~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~
area		transaction	Total transaction
1	North	100	100
2	South	200	300
3	North	-50	250
4	South	320	570
5	East	200	770
6	East	-50	720

Total the 'transaction' column separately for each 'area' value:

Total	¢ ⊞ 23					
? Add a new column with a running (cumulation						
Column:	transaction 🔻					
By:	area					

L

^								
	area	transaction	Total transaction					
1	North	100	100					
2	South	200	200					
3	North	-50	50					
4	South	320	520					
5	East	200	200					
6	East	-50	150					

One.

Options

- Uncheck **automatic new column name** to set a name for the newly created column in **New column name**.
- Set **Column** to the column you want to total.
- Set **By** to a column if you want a separate running total per value in that column. Leave as <**None selected>** if you only want a single running total.

Notes

- Non-numerical values are ignored.
- The **By** column takes account of case and whitespace in values.
- The new column is added at the right end. You can change the column order with <u>Reorder</u> <u>Cols</u> and the column name with <u>Rename Cols</u>.

See also

- <u>Count</u>
- <u>Pivot</u>
- <u>Stats</u>

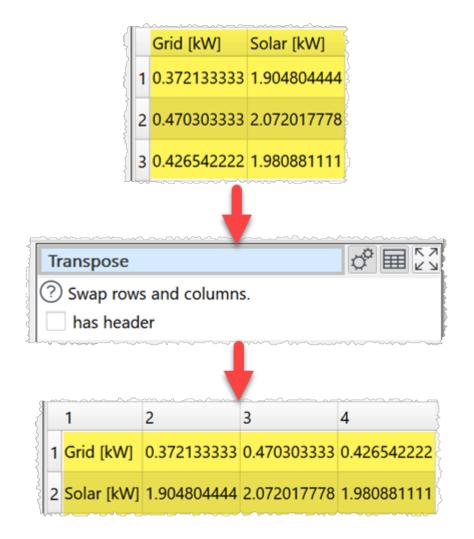

2.3.63 Transpose

Description

Swap (rotate) rows and columns, so that each row becomes a column and each column becomes a row.

Example

Swap rows and columns:

One.

Options

• Check has header to make the new first row into a header.

Notes

• If the input dataset has a header, it will become the new first column. Use <u>Remove Cols</u> to remove it.

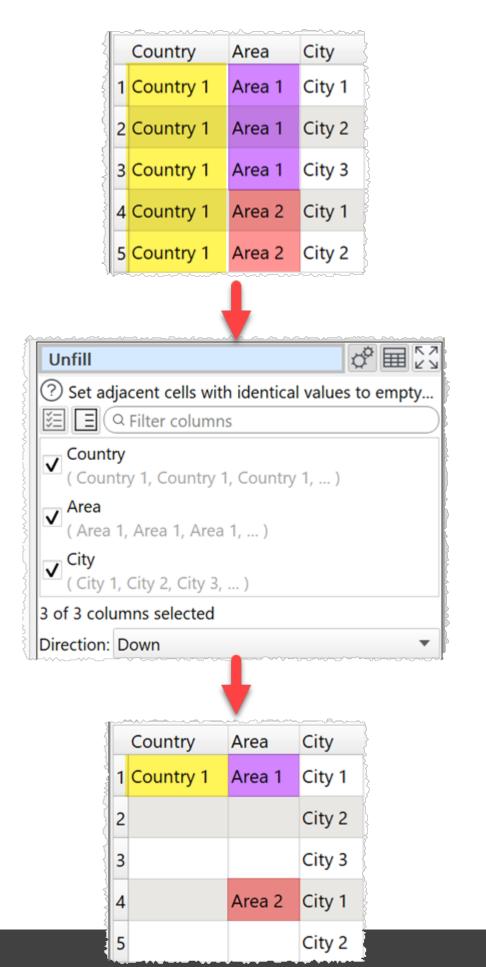

2.3.64 Unfill

Description

Set adjacent cells with identical values to empty in selected columns.

Example

Unfill down:

One.

Options

- Check the column(s) you wish to unfill.
- Select **Direction** depending on the direction you wish to unfill to.

See also

- <u>Fill</u>
- <u>Slide</u>

2.3.65 Unique

Description

Remove duplicate rows based on keeping only unique values in selected columns

Example

If you have a dataset of orders and you want to:

- keep one row per unique Customer Id
- keep the first listed Name for each Customer Id
- concatenate Product Ids for each Customer Id, delimited by a comma
- sum the Costs for each Customer Id
- keep the latest Date for each Customer Id
- add a Count column showing how many rows in the input correspond to each row in the output

	Name	Customer Id	Product Id	Cost	Date
1	Alice Anderson	C018930	13574	29.95	01/10/2020
2	Bob Brown	C018917	89456	10.55	01/10/2020
3	Charlie Jones	C017783	96352	19.95	02/10/2020
4	Robert Brown	C018917	98526	10.00	02/10/2020
5	Charles Jones	C017783	38746	25.00	03/10/2020

Unique		¢ 🗏 🖂
Remove duplicate rows, kee	ping only rows with unique	values in se
Column	Option	
Name	Keep first	•
Customer Id	Keep unique	•
Product Id	Concat	•
Cost	Sum	•
Date	Maximum	•
Set All	▼ to Keep unit	que 🔻
'Keep unique' for 1 of 5 columns	5	
Concat delimiter: ,		
✓ add count	column	

	Name	Customer Id	Product Id	Cost	Date	Count
1	Alice Anderson	C018930	13574	29.95	01/10/2020	1
2	Bob Brown	C018917	89456,98526	20.55	02/10/2020	2
3	Charlie Jones	C017783	96352,38746	44.95	03/10/2020	2

One.

Options

- Set an **Option** for each column:
 - o Only 1 row is kept where all the Keep unique columns have the same value.
 - o Keep first keeps the first value in the current sort order.
 - Keep first non-empty keeps the first value in the current sort order that is not empty.
 - o Keep last keeps the last value in the current sort order.
 - Keep last non-empty keeps the last value in the current sort order that is not empty.
 - o Sum sums any numerical values. Empty values are ignored.
 - o Maximum keeps the maximum numerical or date value.
 - o Minimum keeps the minimum numerical or date value.
 - Average takes the average (mean) of any numerical values. Empty values are ignored.
 - Concat to concatenate values. Duplicate values are kept. All values are treated as text.
 - Concat unique to concatenate values. Duplicate values are ignored. All values are treated as text.
- Use the **Set** button to quickly set the option value for multiple columns.
- Set **Concat delimiter** if you want to add a delimiter between **Concat** or **Concat unique** values
- Check **add count column** to add a column showing how many rows in the input dataset created each unique row.
- Check **drilldown** to allow double clicking a row in the data table to <u>drilldown</u> to the rows that contributed to this row in the upstream data.

Notes

- Rows are considered duplicates if they have exactly the same value in <u>all</u> the columns set to Keep unique. Comparisons are case and whitespace sensitive. You can use <u>Case</u> and <u>Whitespace</u> to change case and whitespace before deduping.
- If no columns are set to Keep unique the transform won't do anything.
- If you are using **Keep first**, **Keep last**, **Keep first non-empty** or **Keep last non-empty** the sort order is important. You can use <u>Sort</u> to change the sort order before this transform.
- Cells containing whitespace are not considered empty.
- The <u>Dedupe</u> transform is a less powerful (but simpler and faster) alternative to Unique.
- The opposite Unique is <u>Split Col</u> with **Into** as **Rows**

See also

• <u>Dedupe a dataset</u>

Reference

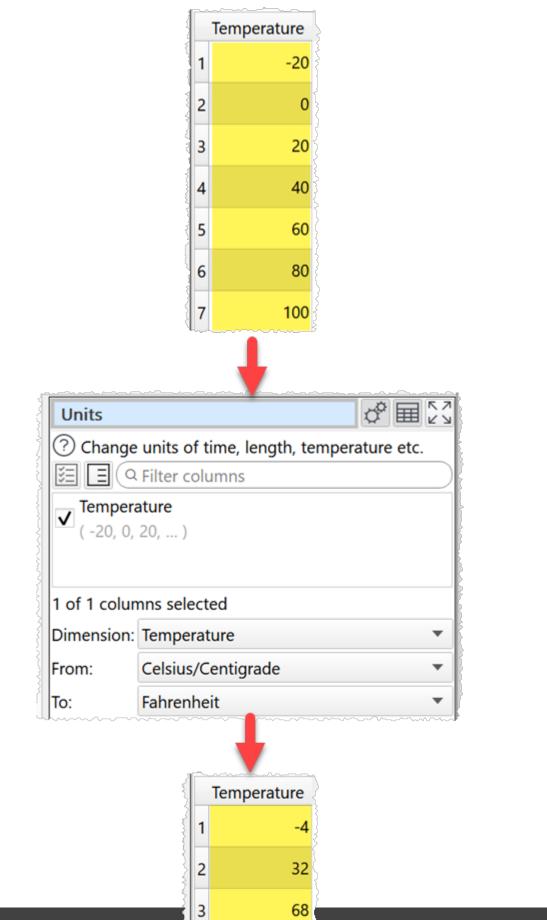

2.3.66 Units

Description

Change units of time, length, temperature etc.

Example

Convert the 'Temperature' column from Celsius to Fahrenheit:

104

One.

Options

- Check the column(s) you wish to transform.
- Set **Dimension** to the dimensions of the units you wish to convert.
- Set From to the units you wish to convert from.
- Set **To** to the units you wish to convert to.

Notes

- The <u>locale</u> is used to decide how the number is represented (e.g. decimal separators).
- Unit disambiguation:
 - Years are 365.25 days.
 - o Calories are thermal/small/gram (not nutritional) Calories.
 - o Miles are International/Statute Miles.
 - o Nautical miles are International Nautical Miles.
 - Gallons (US) are liquid gallons.
 - \circ Pints (US) are liquid pints.
- Warnings are shown in the **Warnings** tab for non-numeric values.
- Non-numerical and empty values are not changed.
- Use <u>Copy Cols</u> to copy columns before you transform them.
- Use <u>Num Format</u> to change the number format of the results.
- Use <u>Extract</u> or <u>Split Col</u> to remove any unit symbols from the value before conversion, e.g. to change "0.0 Kg" to "0.0".
- If you want to convert units not covered here you can do it using the <u>Javascript</u> transform.

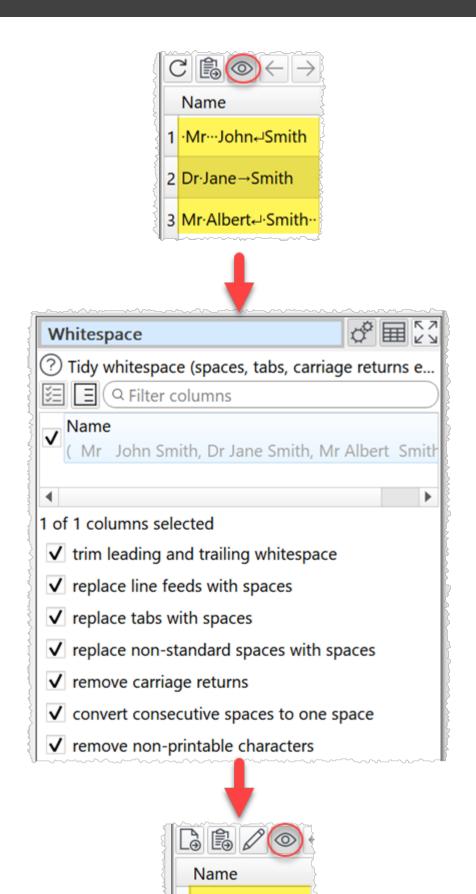

2.3.67 Whitespace

Description

Tidy whitespace (spaces, tabs, carriage returns etc) in the selected column(s).

Example

Tidy tabs, carriage returns and repeated spaces:

1 Mr-John-Smith

2 Dr-Jane-Smith

2 Mr. Albert, Smith

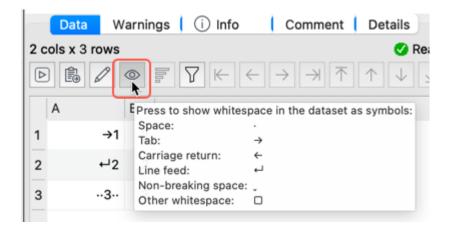

One.

Options

- Check the column(s) you wish to transform.
- Check **trim leading and trailing whitespace** to remove whitespace characters, such as space and tab.
- Check replace line feeds with spaces to replace LF (\n) characters with spaces.
- Check replace tabs with spaces to replace tab (\t) characters with spaces.
- Check **replace non-standard spaces with spaces** to replace non-standard spaces (such as non-breaking space, thin space etc) with spaces.
- Check remove carriage returns to remove CR (\r) characters.
- Check **convert consecutive spaces to one space** to replace 2 or more consecutive spaces with a single space.
- Check remove non-printable characters to remove characters of Unicode type Other_*. This include ASCII codes 0 to 31, such as tab, line feed, carriage return, bell and backspace. It does not remove spaces.

Notes

- The operations are carried out in top to bottom order, e.g. **Replace line feeds with spaces** is carried out before **Convert consecutive spaces to one space**.
- Click the eye icon in the **Right** pane to show whitespace in the data.

2.4 Output

2.4.1 Output data

Once you have finished transforming your data you can output it in the following formats:

- <u>CSV</u>
- <u>Excel</u>
- <u>JSON</u>
- <u>HTML</u>
- <u>Markdown</u>
- Plain text
- <u>TSV</u>
- <u>vCard</u>
- <u>XML</u>
- <u>YAML</u>

To create an output, select 1 input and/or transform item in the <u>Center pane</u> and then click the **To File** button at the bottom of the <u>Left pane</u>. You can choose the file type in the file type drop-down list of the **Output** window.

You can select the output item in the **Center** pane and change any options related to the output in the <u>Right pane</u>.

output.csv		¢	▦	К Л И У			
⑦ Output to file.							
Output to:	Single file			٥			
File:	/Users/andyb/Desktop/output.c	sv					
Type:	Delimited text			٢			
Delimiter:	Comma (,)			٥			
Quoting:	As needed			٥			
Line endings:	Automatic			٢			
Encoding:	UTF-8			٢			
	🗸 Byte Order Mark						
Write mode:	Overwrite			٢			
	🗹 write header						
Alias:	output1						

Set **Output to** depending on whether you want to output the dataset to a single file or <u>multiple files</u>.

Set **File** to the location of the file you want to output (only available when **Output to** set to **Single file**). The location can use <u>file name variables</u> to dynamically change output file names based on input file names.

Set **Files column** to the column containing the location of the files you want to output to (only available when **Output to** set to **Multiple files**).

- This column is not output.
- The location can be an absolute location (e.g. /Users/andy/output.csv) or a location relative to the .transform file location (e.g. results/output.csv).
- The location can use <u>file name variables</u> to dynamically change output file names based on input file names.
- Folders output to must already exist.
- Empty or invalid locations (e.g. file names with illegal characters) are ignored.
- Check **Confirm files** if you want to manually confirm before writing to output files (ignored for <u>command line processing</u>).

If you are writing to an Excel file the output will be written to a sheet called 'Easy Data Transform' by default. You can change this by adding the sheet name inside [], e.g. myfile.xlsx[mysheet].

Set **Type** to the file type. The default type will be set according to the file extension and the settings in the **Output Extensions** tab of the <u>Preferences window</u>.

Set **Value types** depending on how you want to set JSON types (only available for JSON files).

- Automatic to let Easy Data Transform decide the JSON type depending on the contents of each column.
- String to set the JSON type for all columns to String
- Manual to choose the JSON type of each column as:
 - Automatic (based on column contents).
 - \circ Boolean.
 - o Number.
 - \circ String.

If you output a column as Boolean or Number any values not of that type will be output as null.

Set **Delimiter** to the delimiter you wish to use (only available for delimited text files, such as <u>CSV</u> and <u>TSV</u>).

Set **Quoting** depending how you want to use quoting in the output (only available for delimited text files, such as <u>CSV</u> and <u>TSV</u>).

- **As needed** to add quotes (") around values that contain the delimiter character, quote characters or carriage returns.
- Always to add " quotes around every value.
- **Never** to never add " quotes around values (delimiters and carriage returns with values are replaced with spaces).

Set **Line endings** to the control characters you wish to use to denote line endings (only available for text files).

- Automatic to choose the standard line ending for the current operating system.
- Windows (CRLF) to choose the standard Windows line ending, carriage return+line feed (\r\n).
- Mac\Unix (LF) to choose the standard macOS/Unix line ending, line feed (\n).
- Old Mac (CR) to choose the standard classic (pre mac OS X) Mac line ending, carriage return (\n).

Set **Encoding** to the text encoding you wish to use (only available for text files).

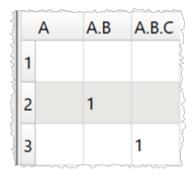

Set **Formatting** depending on how you want to set the Excel cell formatting (only available for Excel files).

- **Automatic** to let Easy Data Transform decide cell formatting depending on the contents of each column.
- General to set the cell format for all columns to 'General'.
- Manual to choose the cell format of each column as:
 - \circ Automatic (based on column contents).
 - o Boolean (expects true or false, not case sensitive)
 - o Date (expects a date format in <u>Preferences</u>).
 - \circ General.
 - o Number (expects a real or integer number, e.g. 123 or 123.456)
 - \circ Text.
 - \circ Formula (expects starting with =).
 - o Time (expects hh:mm:ss or hh:mm, e.g. 13:59:01 or 13:59).
 - o Hyperlink (expects a hyperlink, e.g. https://www.easydatatransform.com).

Set **Byte Order Mark** checked to write a Unicode Byte Order Mark to the file (only available for UTF encodings and ignored when appending to an existing file).

Set **Escape special characters** checked to escape HTML special characters (for example < and >) so they are rendered correctly in the HTML (only available for HTML files). Uncheck it to write 'raw' HTML. Note that you can also set **Change** to **To escaped HTML** to escape selected columns in the <u>Decode</u> transform.

Check **remove empty** to recursively remove any nodes that have an empty value and no children (only available for JSON and XML files). For example:

Is output to XML with remove empty checked as:

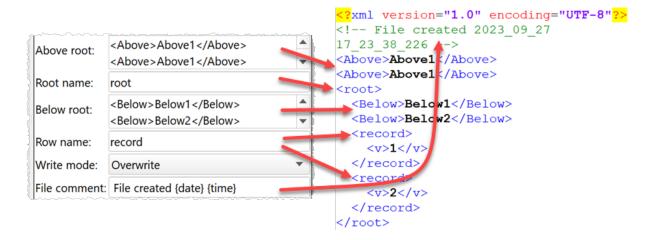

```
<root>
        <record>
        <A>
        <B>1</B>
        </A>
        </record>
        <record>
        <A>
        <C>1</C>
        </B>
        </A>
        </record>
        </B>
        </A>
        </record>
        </record>
        </record>
        </record>
        </record>
        </record>
        </record>
        </record>
```

Is output to XML with remove empty unchecked as:

```
<root>
  <record>
    <A>
      <B>
        <C></C>
      </B>
    </A>
  </record>
  <record>
    <A>
      <B value="1">
        <C></C>
      </B>
    </A>
  </record>
  <record>
    <A>
      <B>
        <C>1</C>
```

```
</B>
</A>
</record>
</root>
```

For XML output you can set **Root name**, **Below root** and **Row name** depending on the name you want to use for the root and row records and any extra information you want to add below the root.

Use Write mode to determine how existing files are treated:

Write mode for Excel files	File exists with named sheet	File exists without named sheet	File does not exist
Overwrite / File	Overwrite named sheet, delete all other sheets	Add named sheet, delete all other sheets	Create file with only named sheet
Overwrite / Sheet	Overwrite named sheet*	Add named sheet	Create file with only named sheet
Append	Append to named sheet	Add named sheet	Create file with only named sheet
New	Do nothing	Do nothing	Create file with only named sheet
Disabled	Do nothing	Do nothing	Do nothing

*Overwriting a named sheet is slower than creating a new file and can cause the file size to increase each time (due to indexing by Excel). If this becomes a problem, you can delete the file and re-output it. Because of this you should use **Overwrite / File** if the file will only have 1 sheet.

Write mode for non-Excel files	File exists	File does not exist
Overwrite	Overwrite file	Create file
Append	Append to file	Create file
New	Do nothing	Create file
Disabled	Do nothing	Do nothing

Check **write header** to write the header (only available for Excel, Delimited text, HTML and Markdown files). If **Write mode** is **Append** you can check **if empty** to only write the header if the file (sheet for Excel files) is currently empty or does not exist (and not for subsequent appends).

Set **File comment** to any comment you wish to output to the file (only available for HTML, Markdown, XML and YAML files). This can include <u>file name variables</u> such as {date}. Leave it empty to output no comment.

Use Alias to identify the file for batch processing.

2.5 File formats

2.5.1 File formats

Easy Data Transform supports the following data file formats:

Format	Input	Output
Delimited text (including <u>CSV</u> and <u>TSV</u>)	Yes	Yes
Excel XLSX/XLS	Yes	Yes
Fixed width	Yes	No
<u>JSON</u>	Yes	Yes
HTML	No	Yes
<u>Markdown</u>	No	Yes
<u>Plain text</u>	Yes	Yes
<u>vCard</u>	Yes	Yes

Format	Input	Output
XML	Yes	Yes
YAML	No	Yes

You can manage the default file type for different file extensions in the **Input Extensions** and **Output Extensions** tabs of the <u>Preferences window</u>.

2.5.2 CSV format

Easy Data Transform can input from and output to CSV format files. Default file extension ".csv".

CSV (Comma Separated Value) format is commonly used for exchanging tabular data between programs.

CSV is a type of delimited text file format. The column delimiter is usually a comma, but not always. The row delimiter is line feed, carriage return or carriage return+line feed.

Easy Data Transform supports the following column delimiters:

- Comma (,)
- Semi-colon (;)
- Colon (:)
- Pipe (|)
- Caret (^)
- Tab (\t) (used for <u>TSV format</u>)
- ASCII Unit separator (0x1F)
- Space ()
- Custom (choose your own)

For files padded to fixed column widths with space see <u>Fixed width format</u>. For file with no column delimiters see <u>Plain text format</u>.

To output to a CSV file you should typically set **Delimiter** to **Comma (,)** and **Quoting** to **As needed** in the **Right** pane.

For example:

	CategoryID	CategoryName	Description	In stock
1	1	Beverages	Soft drinks, coffees & teas	true
2	2	Condiments	Sweet and savory sauces	false
3	3	Confections	Candies and sweet breads	true

Is output with Delimiter set to Comma (,) and Quoting set to As needed as:

```
CategoryID, CategoryName, Description, In stock
1, Beverages, "Soft drinks, coffees & teas", true
2, Condiments, Sweet and savory sauces, false
3, Confections, Candies and sweet breads, true
```

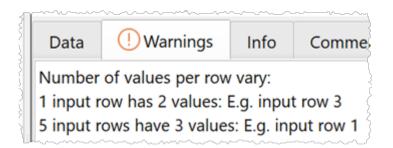

Note that " quotes have been used to enclose values that contain delimiter characters.

Check **ignore repeated delimiters** if you want to treat 2 or more consecutive delimiters as a single delimiter. For example, this might be useful if values are separated by a variable number of spaces:

Set **Quoting** to **Always** if you want to quote every value. Set **Quoting** to **Never** if you don't want to quote values (delimiters, line feeds and carriage returns within values will be changed to spaces, unless the delimiter is space in which case they will be changed to underscore).

You will be warned when inputting a CSV format file that has a different number of values per row. This may be a sign that there are problems with the data (e.g. incorrect quoting).

You can also input a file as plain text and split it using delimiters yourself:

- 1. Input it with a delimiter unlikely to be in the text, e.g. caret (^), to input it as a single column
- 2. Use the <u>Split Col</u> transform to transform it into multiple columns using the appropriate delimiter.

Many CSV file are not well formed. For example, they have unescaped quotes. As the CSV format is not well-defined, badly formed CSV files can be interpreted in more than one way. Easy Data Transform will do the best it can in these circumstances.

2.5.3 Excel format

Easy Data Transform can input from and output to Excel ".xlsx" and ".xls" format files, even if you don't have Excel installed.

Excel format is the native format of the Microsoft Excel spreadsheet application. It is commonly used for exchanging tabular data.

You can specify the sheet name when inputting or outputting Excel files using square brackets, for example:

- MySpreadsheet.xlsx[Sheet1] means the sheet named Sheet1 of file MySpreadsheet.xlsx (the sheet name is not case sensitive).
- MySpreadsheet.xlsx[1] means sheet named 1 of file MySpreadsheet.xlsx (if it exists) or else the first sheet.
- MySpreadsheet.xlsx means the first sheet of file MySpreadsheet.xlsx.

Hyperlinks are read in from Excel in the form anchor | hyperlink.

You can specify how to format columns when outputting to Excel using the **Formatting** option.

Please note the following limitations of Excel:

- Excel .xlsx files are limited to 1,048,576 rows and 16,384 columns.
- Excel .xls files are limited to 65,536 rows and 256 columns.
- Date values are input using ISO date format <u>yyyy-MM-dd</u>, regardless of your locale.
- Datetime values are input using ISO date format <u>yyyy-MM-ddThh:mm:ss</u>, regardless of your <u>locale</u>.
- The following characters are not allowed in sheet names: \ / * [] : ?
- Writing an Excel file is significantly slower than writing a <u>CSV file</u> for the same dataset.

Note that reading an writing Excel files is at least an order of magnitude slower than reading and writing delimited text files, such as <u>CSV</u> or <u>TSV</u>.

- <u>Video: How to remove Excel duplicates</u>
- Video: How to split a column in Excel

2.5.4 Fixed width format

Easy Data Transform can input from fixed width format files, also known as fixed column width format. Default file extension ".txt".

Fixed width format is used for exchanging tabular data between programs. It is often associated with legacy systems, but is also used for large files where performance is an issue (e.g. bioinformatics).

In fixed width format each column has a fixed width in characters. There is no column delimiter. Spaces are typically used as padding to make up the column width. The row delimiter is line feed, carriage return or carriage return+line feed. For example:

ID	Name	Payment	Country	Date
8904	John Black	12345.67	GB	08/20/2020
3999	Jane Brown	23456.78	US	08/20/2020
7489	Zadie Green	34567.89	DE	08/20/2020

Is input as:

į		ID	Name	Payment	Country	Date
The second second	1	8904	John Black	12345.67	GB	08/20/2020
1	2	3999	Jane Brown	23456.78	US	08/20/2020
1	3	7489	Zadie Green	34567.89	DE	08/20/2020

Easy Data Transform will analyze the data and guess the column layout if you set **Columns** in the **Right** pane to **Automatic**. Or you can choose the column widths by setting **Columns** to **Manual**. Click the '...' button to edit the manual column widths.

Preview 0000000 1234567 ID N 8904 J 3999 J	000111111111 7890123456789 Name John Black Jane Brown	22222222 01234567 Payment 12345.67 23456.78	22333333333 89012345678 Country GB US	3344444444 39012345678 Date 08/20/2020 08/20/2020		Columns

You can change the column widths using the **Width** column of the table.

Select 2 or more adjacent columns and click **Merge** to merge them into 1 column. Click then Shift+click in either the table or the preview to select multiple adjacent columns.

Select 1 column with a **Width** > 1 and click **Split** to split into 2 columns.

Select 1 or more adjacent columns and click **Insert Left** or **Insert Right** to add a new column with width 1 to the left or right of the selected columns.

Select 1 or more adjacent columns and click **Delete** delete the selected columns.

Click **OK** to save your changes and **Cancel** to discard them.

Unwanted columns and rows in the dataset can be removed after input using the <u>Remove</u> <u>Cols</u> and <u>Filter</u> transforms.

See also:

• Video: How to convert fixed column width to CSV or Excel

2.5.5 JSON format

Easy Data Transform can input from and output to JSON format files. Default file extension ".json".

JSON (Javascript Object Notation) format is commonly used for exchanging data between programs. JSON data is generally expected to be in UTF8 encoding without a Byte Order Mark (BOM).

For example:

Ĩ	CategoryID	CategoryName	Description	In stock
1	1	Beverages	Soft drinks, coffees & teas	true
2	2	Condiments	Sweet and savory sauces	false
3	3	Confections	Candies and sweet breads	true

Is equivalent to:

```
[
  {
    "CategoryID": 1,
    "CategoryName": "Beverages",
    "Description": "Soft drinks, coffees & teas",
    "In stock": true
  },
  {
    "CategoryID": 2,
    "CategoryName": "Condiments",
    "Description": "Sweet and savory sauces",
    "In stock": false
  },
  {
    "CategoryID": 3,
    "CategoryName": "Confections",
    "Description": "Candies and sweet breads",
    "In stock": true
  }
]
```

The dot ('.') character is used in the column header to show nesting. For example:

name	carb	cholesterol	fiber	minerals.ca	minerals.fe	protein	sodium	vitamins.a	vitamins.c
1 Avocado Dip	2	5	0	0	0	1	210	0	0

Is equivalent to:

```
[
  {
    "name": "Avocado Dip",
    "carb": 2,
    "cholesterol": 5,
    "fiber": 0,
    "minerals": {
      "ca": 0,
      "fe": 0
    },
    "protein": 1,
    "sodium": 210,
    "vitamins": {
      "a": 0,
      "c": 0
    }
  }
]
```

Any dots in JSON names are converted to hyphens ('-') on input.

JSON arrays can be input in either long or wide **Format**. For example:

```
[
{
    "name": "1",
    "values": [ "a", "b" ]
},
{
    "name": "2",
    "values": [ "c", "d" ]
}
]
```

Input as Long (more rows):

	name	values
1	1	а
2	1	b
3	2	с
4	2	d

Input as Wide (more columns):

	name	values.0	values.1
1	1	а	b
2	2	с	d

If children of the top level object are named, then they are flattened slightly different to avoid creating thousands or millions of columns. For example:

```
{
    "record 1":{
        "value": 1
    },
    "record 2":{
        "value": 2
    },
    "record 3":{
        "value": 3
    }
}
```

Is flattened into:

_ObjectName_value1record 112record 223record 33

An input JSON format file is expected to have either:

- a single top-level array or object; or
- a single JSON object on each line (see jsonlines.org).
- a record separator character followed by a single JSON object on each line (see <u>RFC7464</u>).

You can specify the JSON type for each columns when outputting to JSON using the **Value types** option. The **Raw data** type is output without quotes or escaping and can be useful for data that is already valid JSON. Any values that do not match the type selected are output as a JSON null value.

See also:

- Video: How to convert CSV to JSON
- <u>Video: How to convert Excel to JSON</u>
- <u>Video: How to convert JSON to CSV</u>
- <u>Video: How to convert JSON to Excel</u>

2.5.6 HTML format

Easy Data Transform can output to tables in HTML format files. Default file extension ".html".

HTML (HyperText Markup Language) format is commonly used for creating web pages. If you don't need the data to take up a whole page, you can just copy the to part of the output.

For example:

	CategoryID	CategoryName	Description	In stock
1	1	Beverages	Soft drinks, coffees & teas	true
2	2	Condiments	Sweet and savory sauces	false
3	3	Confections	Candies and sweet breads	true

Is output as:

```
<!DOCTYPE html>
<html>
 <head>
  <meta charset="UTF-8"/>
  <title>C:\Users\andyb\Desktop\output.html</title>
  <style>table,td,th{border:1px solid black;text-
align:left;vertical-align:top;border-spacing:0px;border-
color:gray;font-family:Verdana,sans-serif;}th{background-
color:#E0E0E0; }td, th {padding:5px; }</style>
 </head>
 <body>
  CategoryID
       CategoryName
       >Description
       In stock
     1
       Beverages
       Soft drinks, coffees & amp; teas
       true
     2
       Condiments
       Sweet and savory sauces
       false
     3
       Confections
       Candies and sweet breads
       true
     </body>
</html>
```

Usually you will want to 'escape' special HTML characters in dataset values when output to HTML format. For example to convert < to <, so it can be correctly displayed in the HTML. However, if you wish to write 'raw' HTML, then you can uncheck **Escape special characters** in the **Right** pane. Note that you can also set **Change** to **To escaped HTML** to escape selected columns in the <u>Decode</u> transform.

2.5.7 Markdown format

Easy Data Transform can output to tables in Markdown format files. Default file extension ".md".

Markdown format is commonly used as a human-friendly markup language, which can be automatically translated to HTML.

For example:

CategoryID		CategoryName	Description	In stock
1	1 Beverages		Soft drinks, coffees & teas	true
2	2	Condiments	Sweet and savory sauces	false
3 3		Confections	Candies and sweet breads	true

Is output as:

 	CategoryID	(CategoryName	I	Description		In stock
		· -·		-		-	
	1]	Beverages		Soft drinks, coffees & teas		true
	2	(Condiments		Sweet and savory sauces	Ι	false
	3	(Confections		Candies and sweet breads		true

You can also use Markdown when you need a plain text version of your data, for example in a code comment.

Note that not all Markdown implementations support tables. If your implementation does not support tables, you may need to output to <u>HTML</u> instead.

<u>Video: How to convert CSV to Markdown</u>

• Video: How to convert Excel to Markdown

2.5.8 Plain text format

Easy Data Transform can input from and output to plain text format files. Default file extension is ".log" for input and ".log" or ".txt" for output.

Plain text format is used for semi-structured data, such as computer generated log files.

When inputting plain text the dataset is read into a single column. The row delimiter is line feed, carriage return or carriage return+line feed.

For example:

```
03/22 08:51:01 INFO:..settcpimage: Associate with TCP/IP image name = TCPCS03/22 08:51:02 INFO:..reg_process: registering process with the system03/22 08:51:02 INFO:..reg_process: attempt OS/390 registration03/22 08:51:02 INFO:..reg_process: return from registration rc=0
```

Is input in plain text format as:

	1	and a particulation of the second s
1	03/22 08:51:01 INFO	:settcpimage: Associate with TCP/IP image name = TCPCS
2	03/22 08:51:02 INFO	reg_process: registering process with the system
3	03/22 08:51:02 INFO	:reg_process: attempt OS/390 registration
4		:reg_process: return from registration rc=0

When outputting plain text:

- Each row ends with a line feed, carriage return or carriage return+line feed, as selected by the user.
- Typically plain text datasets only have 1 column. But if there is more than one column, the column values will be concatenated without a delimiter. If you want a delimiter use <u>Concat</u>
 <u>Cols</u> and <u>Remove Cols</u> to create a single column that contains the appropriate delimiters, or output as <u>delimited text</u>.
- Values are not escaped.

2.5.9 TSV format

Easy Data Transform can input from and output to TSV format files. Default file extension ".tsv".

TSV (Tab Separated Value) format is commonly used for exchanging tabular data between programs.

TSV is a type of delimited text file format where values are separated by tab characters and rows by line feed, carriage return or carriage return+line feed. Tabs and carriage return are not allowed within data values, so there is no need for quoting or escaping delimiters, as with <u>CSV files</u>. This means that TSV files are generally a bit more compact and faster to read and write than CSV files.

To input a TSV file you should set **Type** to **Delimited text** and **Delimiter** to **Tab (\t)** in the **Right** pane. You will usually also want to uncheck **ignore repeated delimiters** and set **Quoting** to **Automatic** (which is the same as **Unquoted** for tab delimiters).

You will be warned when inputting a TSV format file that has a different number of values per row. This may be a sign that there are problems with the data.

Data	U Warnings	Info	Comme
Number	of values per row	vary:	
1 input r	ow has 2 values: I	E.g. input	t row 3
5 input r	ows have 3 values	s: E.g. inp	out row 1

To output a TSV file you should set **Delimiter** to **Tab (\t)**. You will usually also want to set **Quoting** to **Never** in the **Right** pane. If you have a tab character or carriage return within a value, then Easy Data Transform will then convert it to a space on output.

For example:

Ĩ	CategoryID	CategoryName	Description	In stock
1	1 Beverages		Soft drinks, coffees & teas	true
2	2	Condiments	Sweet and savory sauces	false
3	3	Confections	Candies and sweet breads	true

Is output with **Delimiter** set to **Tab (\t)** and **Quoting** set to **Never** as:

CategoryID \rightarrow CategoryName \rightarrow Description \rightarrow In \cdot stock \rightarrow Beverages \rightarrow Soft \cdot drinks, \cdot coffees \cdot & \cdot teas \rightarrow true \rightarrow Condiments \rightarrow Sweet \cdot and \cdot savory \cdot sauces \rightarrow false \rightarrow Confections \rightarrow Candies \cdot and \cdot sweet \cdot breads \rightarrow true

See also:

- <u>Video: How to convert tab delimited to CSV</u>
- <u>Video: How to convert CSV to tab delimited</u>

2.5.10 vCard format

Easy Data Transform can input from and output to vCard format files. Default file extension ".vcf".

VCard format is commonly used as way of exchanging contact details between programs.

Note that you need to change the column header names to the <u>values expected by vCard</u> (using the <u>Rename Cols</u> transform). For example vCard expects the full name column to be named FN.

Choose an appropriate text encoding. You should probably uncheck **Byte Order Mark** if you are encoding in a UTF format, such as **UTF-8**.

For example:

3	N		FN	0	TEL;TYPE=WORK,VOICE	ADR;TYPE=WORK,PREF
~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~	1 Gump	;Forrest;;Mr.;	Forrest Gump	Bubba Gump Shrimp Co.	(111) 555-1212	100 Waters Edge;Baytown;

Is equivalent to:

```
BEGIN:VCARD
VERSION:3.0
N:Gump;Forrest;;Mr.;
FN:Forrest Gump
ORG:Bubba Gump Shrimp Co.
TEL;TYPE=WORK,VOICE:(111) 555-1212
ADR;TYPE=WORK,PREF:100 Waters Edge;Baytown;LA;30314;United States of
America
END:VCARD
```

#### See also:

• Video: How to convert CSV to vCard

#### 2.5.11 XML format

Easy Data Transform can input from and output to XML format files. Default file extension ".xml".

XML (Extensible Markup Language) format is commonly used for exchanging data between programs.

For example:

	CategoryID	CategoryName	Description	In stock
1	1 Beverages		Soft drinks, coffees & teas	true
2	2	Condiments	Sweet and savory sauces	false
3	3	Confections	Candies and sweet breads	true

Is equivalent to:

```
<?xml version="1.0" encoding="UTF-8"?>
<root>
  <record>
    <CategoryID>1</CategoryID>
    <CategoryName>Beverages</CategoryName>
    <Description>Soft drinks, coffees &amp; teas</Description>
    <In-stock>true</In-stock>
  </record>
  <record>
    <CategoryID>2</CategoryID>
    <CategoryName>Condiments</CategoryName>
    <Description>Sweet and savory sauces</Description>
    <In-stock>false</In-stock>
  </record>
  <record>
    <CategoryID>3</CategoryID>
    <CategoryName>Confections</CategoryName>
    <Description>Candies and sweet breads</Description>
    <In-stock>true</In-stock>
  </record>
</root>
```

The dot ('.') character is used in the column header to show nesting. For example:

name	carb	cholesterol	fiber	minerals.ca	minerals.fe	protein	sodium	vitamins.a	vitamins.c
1 Avocado D	р 2	5	0	0	0	1	210	0	0

261

Is equivalent to:

```
<?xml version="1.0" encoding="UTF-8"?>
<root>
  <record>
    <name>Avocado Dip</name>
    <carb>2</carb>
    <cholesterol>5</cholesterol>
    <fiber>0</fiber>
    <protein>1</protein>
    <sodium>210</sodium>
    <minerals>
      <ca>0</ca>
      <fe>0</fe>
    </minerals>
    <vitamins>
      <a>0</a>
      <c>0</c>
    </vitamins>
  </record>
</root>
```

Note that the columns may be input in a different order to the nodes in the XML. You can <u>use</u> <u>Reorder Cols or Stack transforms to change the ordering</u>. But note that during XML output nodes with no children are always ordered before nodes with children, regardless of the column order.

Any dots in XML element names are converted to hyphens ('-') on input.

The underscore ('_') character is used at the start of a column header name to identify it as an XML attribute. For example:

mar .	_name	_carb	_cholesterol	_fiber	minerals.ca	minerals.fe	_protein	_sodium	vitamins.a	vitamins.c
- 51	1 Avocado Dip		5	0	0	0	1	210	0	0

Is equivalent to:

```
<?xml version="1.0" encoding="UTF-8"?>
<root>
<record carb="2" cholesterol="5" fiber="0" name="Avocado Dip"
protein="1" sodium="210">
<minerals>
<ca>0</ca>
<fe>0</fe>
</minerals>
<vitamins>
<a>0</a>
<c>0</c>
</vitamins>
```

</record> </root>

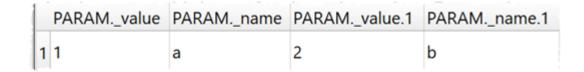

Repeated XML values can be input in either long or wide Format. For example:

```
<?xml version="1.0" encoding="UTF-8"?>
<ITEMS>
<ITEM>
<PARAM name="a" value="1"/>
<PARAM name="b" value="2"/>
</ITEM>
</ITEM>
```

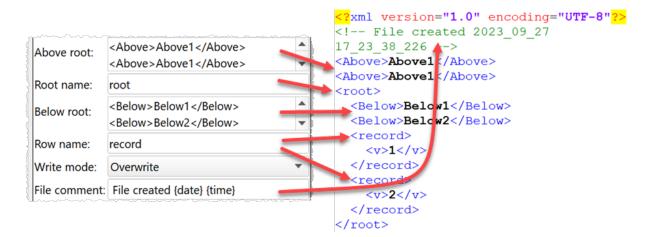

Input as Long (more rows):

PARAMname		PARAMvalue
1	b	2
2	а	1

Input as Wide (more columns):

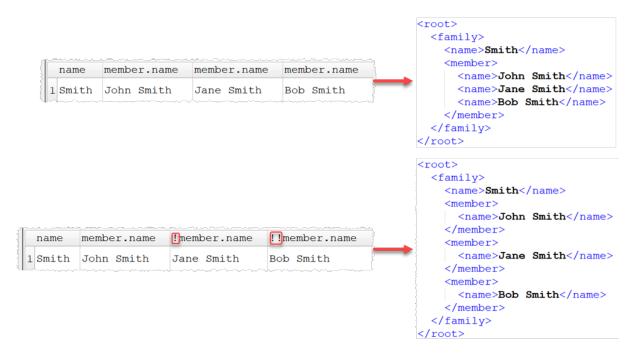

You can set the names for the root and record tags and add extra XML below the root:

Use '.' if you need nested tags:

		<pre><?xml version="1.0" encoding="UTF-8"?></pre>
		File created 2023_09_27</th
		17_31_09_740>
	production and the second s	<above>Above1</above>
Above root:	<above>Above1</above>	<above>Above1</above>
	<above>Above1</above>	<root1></root1>
Root name:	root1.root2	<below>Below1</below>
		<below>Below2</below>
Below root:	<below>Below1</below>	<pre><root2></root2></pre>
	<below>Below2</below>	<record></record>
Row name:	record	<v>1</v>
now name.		
Write mode:	Overwrite 🔻	<record></record>
File commont:	File created (date) (time)	<v>2</v>
File comment.	File created {date} {time}	

Exclamation marks at the start of column names are removed from name tags when output to XML. This can be useful when you want duplicate tag names with the same parent.

You are responsible for ensuring that the names of XML nodes and attributes are valid (e.g. start with a letter or underscore and do not contain spaces).

If you need really fine grained control over the XML output, you can:

- output the XML to a file
- read the file back in as plain text
- apply transforms
- write it back out as plain text

output.xml	0 II 🖓					
Output to file.						
Output to:	Output to: Single file					
File:	C:\Users\andy\Desktop\output.xml					
Туре:	Plain text	•

- <u>Video: How to convert XML to CSV</u>
- <u>Video: How to convert XML to Excel</u>
- <u>Video: How to convert CAMT 053 XML to Excel or CSV</u>

#### 2.5.12 YAML format

Easy Data Transform can output to YAML format files. Default file extension ".yaml".

YAML (YAML Ain't Markup Language) format is commonly used for exchanging data between programs and for configuration files.

For example:

	CategoryID	CategoryName	Description	In stock
1	1	Beverages	Soft drinks, coffees & teas	true
2	2	Condiments	Sweet and savory sauces	false
3	3	Confections	Candies and sweet breads	true

Is output as:

```
---

CategoryID: 1

CategoryName: Beverages

Description: Soft drinks, coffees & teas

In stock: true

-

CategoryID: 2

CategoryName: Condiments
```

```
Description: Sweet and savory sauces
In stock: false
CategoryID: 3
CategoryName: Confections
Description: Candies and sweet breads
In stock: true
```

See also:

<u>Video: How to convert Excel to YAML</u>

## 2.6 Processing

You can run processing of your data in one of two modes:

• Automatic mode: Processing is run automatically as soon as you have stopped making changes for the amount of time specified in the <u>Preferences window</u>.

• Manual mode: You control when processing is run.

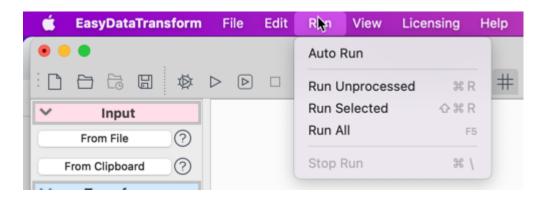

• •	•					
Ë	Ð	63	₿	$\triangleright$	$\triangleright$	

You can switch between modes by toggling **Run>Auto Run**, or the equivalent tool bar button.

Typically automatic mode is better for small to medium datasets, but manual mode may be a better choice for large datasets.

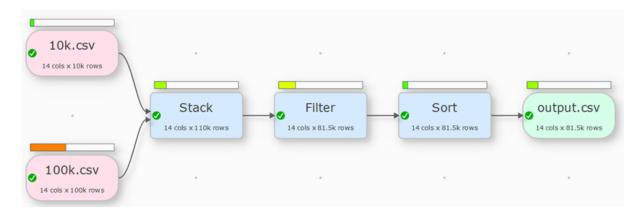

There are 3 options for running processing in manual mode:

- Run>Run Unprocessed: Run processing on any items that are not already processed.
- **Run>Run Selected**: Run processing on one or more selected items, even if they are already processed. Any upstream or downstream items are also processed.
- **Run>Run All**: Run processing on all items, even if they are already processed. This is provided for completeness, but you should usually use one of the above 2 options, for efficiency.

You can also click the **Run** button in the **Right** pane, which is equivalent to **Run>Run Selected**. Note that **Run**, for a clipboard input, applies the options to data previously imported. If you want to re-import from the clipboard in automatic mode, then you have to click the **Import from clipboard** button.

Check **View>Timing Profile** to see where the processing time is being spent. The length of the colored bar is proportional to the fraction of total processing spent processing that item.

You can stop processing with **Run>Stop Run**, or the equivalent tool bar button. If you stop processing in automatic mode it will switch to manual mode.

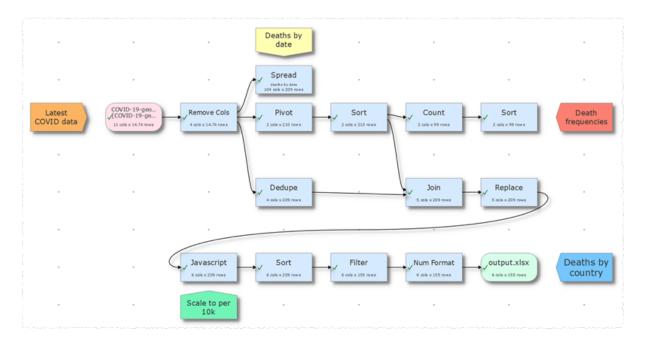

When an item is processed, all it's upstream items will be processed first. You can only change the options for an item in the **Right** pane if all it's upstream inputs and transforms are processed.

## 2.7 Comments

You can manage the complexity of large .transform files adding comment text to:

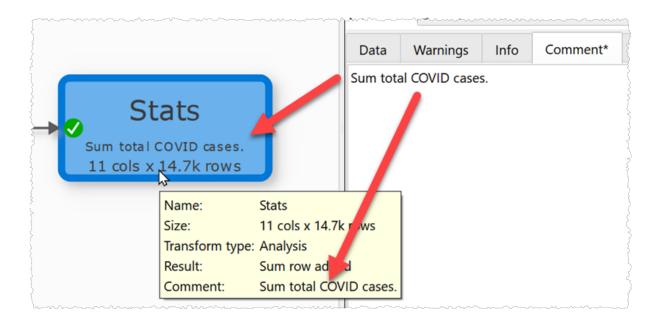

• The **Comment** field of Note items. These are added to the **Center** pane by right clicking and selecting **Note** from the menu. You can also set an **Arrow** direction and a **Color**. If you

right click on an existing item, the Note item will be placed pointing to that item, if there is space. The comment will be shown as a tooltip when you hover over the Note item.

• The **Comment** tab of Input, Transform or Output items. Check **View>Show Comments** to show these comments in the **Center** pane. The comment will be shown as a tooltip when you hover over the item.

• In the **Notes** window that is displayed when you select **File>Notes...** from the main menu.

You can also visually group related items in the **Center** pane to show that they are related.

# 2.8 Headers

If the first row of an input is a header (i.e. one that describes the columns below) check **has header** for that input in the **Right** pane.

vaccinatio	on.csv 🕜 🗳	K Z			
File:	/Users/andyb/Desktop/vaccination.csv				
Type: Delimited text					
Delimiter:	Automatic	٥			
Quoting:	Automatic	٥			
Encoding:	Automatic	٥			
Ignore:	First <u>0 row(</u> s)	1			
(	<ul> <li>✓ trim whitespace</li> <li>✓ simplify whitespace</li> <li>✓ ignore empty rows</li> <li>watch file</li> </ul>				
Meta info:	Not added	٥			
Alias:	vaccination				
Data	Warnings Info Comment Results				
3 cols x 5,	780 rows				
C 🔒 🖉 💿 Show first 10 rows 🗘					
count	ry time bcg_vacc				

When you first read in a dataset Easy Data Transform will make a guess about whether the first row is a header (it will assume it is a header if it contains no <u>dates</u> or <u>numbers</u>).

You can move 1 or more dataset rows to the header using the <u>Header</u> transform.

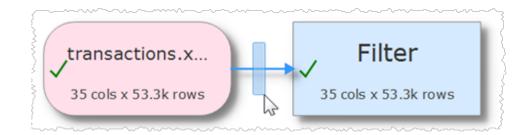

## 2.9 Connections

When you select an input or transform item and add a transform or output item, connections are added automatically.

## To select a connection

To select a connection either:

- Click on the connection; or
- Click and drag a box over any part of the connection. This may be easier than clicking the connection when you are zoomed back.

# To delete a connection

To delete a connection:

- Select the connection.
- Select Edit>Delete (or click the Delete tool bar button).

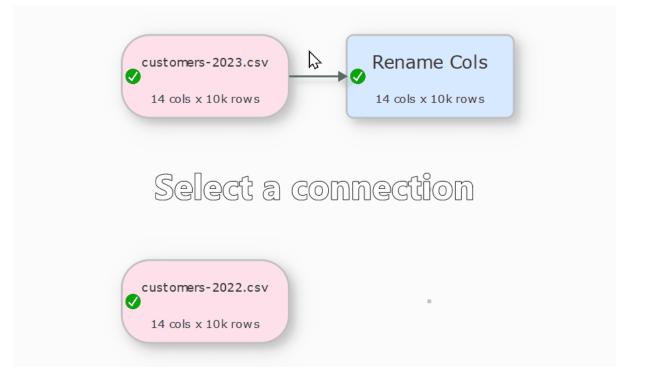

Note that deleting a connection may unset column related parameters downstream, so should <u>generally be avoided</u> where possible.

- If you want to change an input file, do it by selecting the input and clicking on '...' in the **Right** pane, rather than disconnecting the input and connecting a new one.
- If you want to add a new transform between 2 already connected items, you can do it without disconnecting (see below).

## To add a transform to a connection

To add a transform between two already connected items:

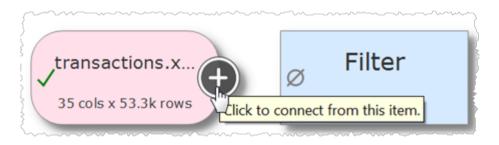

- Select the connection.
- Choose the new transform from the **Left** pane or using the right click menu.

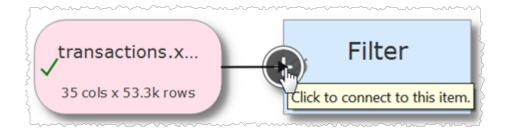

# To add a connection

To add a new connection between two existing items:

- Hover over the start item.
- Click the '+' that appears.

- Hover over the end item
- Click the '+' that appears.

Press the 'Esc' key or click away from an item to cancel adding the connection.

Note that the '+' will only appear if an additional connection is allowed. For example you can't:

- Create a loop.
- Connect more than once from a transform.
- Connect more than once to an output.

#### 2.10 Text

Whitespace (such as Space and Tab characters) and case are always significant, unless stated otherwise.

You can remove leading and trailing whitespace by checking **trim whitespace** in the <u>Input</u> or using the <u>Whitespace</u> transform.

You can change the case using the <u>Case</u> transform.

You can concatenate and split columns of text using the Concat Cols and Split Col transforms.

## 2.11 Dates

Set **Supported Date Formats** in the <u>Preferences window</u> according to how you want to interpret values as dates.

Format	Meaning
d	The day as number without a leading zero (1 to 31)
dd	The day as number with a leading zero (01 to 31)
ddd	The abbreviated localized day name (e.g. 'Mon' to 'Sun'). Uses the <u>locale</u> to localize the name.
dddd	The long localized day name (e.g. 'Monday' to 'Sunday'). Uses the <u>locale</u> to localize the name.
М	The month as number without a leading zero (1 to 12).
MM	The month as number with a leading zero (01 to 12)
МММ	The abbreviated localized month name (e.g. 'Jan' to 'Dec'). Uses the <u>locale</u> to localize the name.
ММММ	The long localized month name (e.g. 'January' to 'December'). Uses the <u>locale</u> to localize the name.
УУ	The year as two digit number (00 to 99).
ХХХХ	The year as four digit number. If the year is negative, a minus sign is prepended in addition.

For example:

- To support a date such as 31/1/2019 add a supported date format: d/M/yyyy
- To support a date such as 1-31-19 add a supported date format: M-d-yy

List the date formats in order of preference, with the most likely to be used first.

Dates with only two year digits, are treated as a date between 1900 and 1999. E.g. "31/1/19" is interpreted in d-M-yy format as 31st January 1919.

Add today date to a dataset using input file <u>meta information</u> or using the <u>Stamp</u> transform.

Values that are in a recognized date format will be treated as dates in transforms such as: <u>Calculate</u>, <u>Compare</u>, <u>Filter</u>, <u>If</u> and <u>Sort</u>. Supporting large numbers of date formats will slow down these transforms.

Change the format of dates using the **DateTime Format** transform.

Do date calculations, such as calculating the number of days between 2 dates, using the <u>Calculate</u> or <u>Javascript</u> transform.

Convert between ISO standard datetimes and milliseconds since 1st Jan 1970 using the <u>Calculate</u> transform.

Convert an ISO standard datetimes (e.g. 2020-10-16T01:51) into separate date and time columns by using the <u>Split Cols</u> transform on the "T" delimiter.

Add missing dates in a sequence using <u>Sequence</u>.

#### 2.12 Numbers

Set the locale according to how you want to interpret values as numbers. For example:

- If locale is set to US or UK then 123, 456.7 is a number and 123.456, 7 isn't
- If locale is set to Germany or France then 123.456, 7 is a number and 123, 456.7 isn't

An integer is a whole number. E.g. 1.0 or 1,0 (depending on your locale), 0, -1 and 1e3 are considered integers.

Numeric values are recognized in the approximate range  $-1 \times 10^{308}$  to  $+1 \times 10^{308}$ .

Numeric calculations are accurate to approximately 16 digits of precision. This means that Easy Data Transform may consider 12345678901234567 and 12345678901234568 to be equal, for example using the = operator in a <u>Filter</u> transform.

NaN means 'not a number'. It can be returned by some calculations, for example using **Calculate** to raise 1000 to the power 1000 will overflow numerically and return NaN.

Change the format of numbers (e.g. the number of decimal places or the decimal symbol) using the <u>Num Format</u> transform.

Change the base of integers (e.g. base 10 to base 16) using the <u>Num Base</u> transform.

Do numeric calculations, such as multiplying 2 columns, using the <u>Calculate</u> or <u>Javascript</u> transforms.

Add missing integers in a sequence using Sequence.

## 2.13 Booleans

A boolean value can be true or false.

Canonical value	Allowed values	Examples
true	true (case insensitive) or a non-zero numeric value	true TRUE True 1 1.0 -1 0.1 999
false	false (case insensitive) or a zero numeric value	false FALSE False 0 0.0

## 2.14 Locale

You can set the Locale in the Preferences window.

Locale:	English	$\odot$	United Kingdc 😌	Default

The locale language and country setting affects how some numbers and dates are interpreted and displayed. Consequently it may have an effect on some transforms, for example the <u>DateTime format</u> and <u>Num format</u> transforms.

This shows using the <u>DateTime format</u> transform with **Format to** set to ddd MMMM d yyyy for different locales:

Locale	Output	
English/United States	Mon May 21 2001	
English/United Kingdom	Mon May 21 2001	
German/Germany	Mo. Mai 21 2001	
French/France	lun. mai 21 2001	
Spanish/Spain	lun. mayo 21 2001	
Italian/Italy	lun maggio 21 2001	
Portuguese/Portugal	segunda maio 21 2001	
Chinese/China	周一 五月 21 2001	
Japanese/Japan	月 5月 21 2001	

You will be warned if you **File>Open** a .transform file with a different locale to the one you have set.

# 2.15 Meta Information

You can add meta information to input data using the **Meta info** field in the **Right** pane when you select an input item.

10k.csv	,				° de la		
Input	from file.						
File:	D:\EDT data\CSV\10k.csv						
	Delim					•	
Ignore:	o row(s)					~	
	E Meta Infor	mation			×		
			1		<b>c</b> 1		
	\$(FilePath) \$(	CurrentDateTi	me)		Clear		
	Insert: <sele< td=""><td>ct&gt;</td><td></td><td></td><td>•</td><td></td></sele<>	ct>			•		
			ОК	Cancel	Help		
l							
Meta info	o: At start				,		
Alias:	10k						
Data	Characters	Warnings	(i) Info	Comment	Details		
14 cols x 10,001 rows 🗸 Read							
	Region					C A	
1	D:\EDT data\CSV\10k.csv 2022-12-05T09:30:29						

Set it to **At start**, **At end** or **Every row**, depending on where you want the meta information to appear. Then click on the ... button to edit which information you wish to show. The following placeholders are substituted by their actual values at the time of input.

Meta Information	Description	Example
\$(ComputerName)	The name of the computer.	MyComputer
\$(CurrentDate)	The current date, in ISO format.	2020-08-18

Meta Information	Description	Example
\$(CurrentDateTime)	The current datetime, in ISO format.	2020-08-18T18:00:00
\$(DataColumns)	The number of columns in the dataset (not including meta data).	10
\$(DataRows)	The number of row in the dataset (not including meta data).	10,000
\$(DataValues)	The number of columns x rows in the dataset (not including meta data).	100,000
\$(FileCreatedDate)	The date the file was created, in ISO format. Only available for file input.	2020-08-18
\$(FileCreatedDateTime)	The datetime the file was created, in ISO format. Only available for file input.	2020-08-18T18:00:00
\$(FileName)	The name of the file, including it's extension. Only available for file input.	myfile.csv
\$(FilePath)	The full path (location) of the file. Only available for file input.	/Users/andy/Documents /myfile.csv
\$(FileSheetName)	The name of the sheet. Only available for Excel file input.	Sheet1
\$(FileSizeBytes)	The size of the file in bytes. Only available for file input.	1,234,567
\$(FileUpdatedDate)	The date the file was last updated, in ISO format. Only available for file input.	2020-08-18
\$(FileUpdatedDateTime)	The datetime the file was last updated, in ISO format. Only available for file input.	2020-08-18T18:00:00

Meta Information	Description	Example
\$(UserName)	The name of the user (from the USER or USERNAME environment variable).	Andy

• <u>Stamp</u>

## 2.16 Column variables

Transforms such as <u>If</u>, <u>Filter</u>, <u>Insert</u>, <u>Replace</u> and <u>Substitute</u> allow you to use the values of columns on the same row using column variables. Column values can be referenced either:

- By column header name, e.g. \$ (item cost) for the 'item cost' column; or
- By column index, e.g. \$ (1) for the first column.

#### Notes:

- The column name is case sensitive. E.g. column 'A' is referenced by variable \$ (A) and column 'a' is referenced by variable \$ (a).
- Whitespace at the start or end of the column name is ignored. E.g. column ' A ' is referenced by variable \$ (A).
- Whitespace within the column variable is important. E.g. column 'AB' is not referenced by variables \$ (A B), \$ (AB) \$ ( AB) or \$ (AB ).
- If multiple columns have the same name, the first column from the left with that name will be used.
- Reference by name takes priority over reference by index. For example, if there is a column named "1" then \$ (1) will refer to that rather than the first column.
- Column variables are replaced as text. For example if column 'A' has value '2' and column 'B' has value '3', then \$ (A) *\$ (B) evaluates as '2*3' (not '6').
- Column names can contain \$, ( and ) characters. For example:

lf		<u></u>			<u> </u>	-~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~	4	° 🖩	К 7 2 У
⑦ Create a new column with values conditional on other columns.									
New colu	mn name: Va	lue							
$\oplus$ ELSE IF $\oplus$ AND $\uparrow \downarrow \otimes$									
Logic	Logic Column Op. Value								
1 IF	currency		•	= 💌	USD				
	= \$\$(value(\$)	)							
3 ELSE=	£\$(value(£)	)							
	$\checkmark$	case sensitive							
Data	Characters	Warnings	Info	Cor	nment	Deta	nils		
5 cols x 2	rows		<b></b>	1 matcl	h(es) IF/E	LSE IF,	1 mate	h(es) l	ELSE
$\mathbf{C} \otimes \mathbf{P} \otimes $									
trans	saction	currency	value	e(\$)	value	(£)	Valu	е	
1	2634543	USD	342	32.33			\$34	232.	.33
2	9233663	GBP			6202	22.94	£62	2022.	.94

## 2.17 Regular expressions

Easy Data Transform allows the use of regular expressions in the <u>Compare</u>, <u>Extract</u>, <u>Filter</u>, <u>If</u>, <u>Replace</u>, <u>Slice</u>, <u>Split Col</u> and <u>Split Rows</u> transforms. It is also available as part of the Javascript language in the <u>Javascript</u> transform.

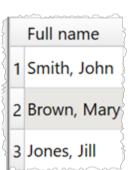

Regular expressions are a powerful way to match patterns in text (including text representation of dates and numbers). For example, you can use a regular expression in the Replace transform to swap first and last names:

	Match Type		Replace	With
1 R	egex	۳	(\w+)\s*(\w+)	\2, \1

Turns:

Into:

Regular expressions are far too big a topic to cover here. However there are many detailed resources online, such as <u>www.regular-expressions.info</u> and <u>regexr.com</u>.

## 2.18 Fuzzy matching

Easy Data Transform supports the use of fuzzy matching in various transforms, including the <u>Cluster</u>, <u>Dedupe</u>, <u>If</u>, <u>Filter</u> and <u>Lookup</u> transforms.

Fuzzy matching allows you to match 2 values that are similar, but not identical. For example if you set fuzzy match closeness to 80% then 2 values that are 80% the same or better are considered a match.

For example, doing a fuzzy match to this value:

100 avenue street, townsville, ohio

Gives:

Value	Fuzzy closeness
100 avenue street, townsville, ohio	100%
100 avnue street, townsville, ohio	98%

Value	Fuzzy closeness
100 avenue street townsville ohio	95%
100 avenue st., townsville, ohio	89%
100 avenue st, townsville	72%
100 av. st., citysville, texas	52%
townsville, ohio	46%
742 evergreen terrace, springfield, oregon	36%

Fuzzy matching treats everything as text and takes account of whitespace. It can optionally take account of case.

Fuzzy matching is significantly slower than exact matching. The closeness score is based on <u>Levenshtein distance</u>.

# 2.19 Drilldown

If you check **allow drilldown** for a transform, double clicking a cell in the **Right** pane data table shows the rows in the upstream dataset that this cell/row was derived from. For example you can double click a cell in a pivot table to drilldown into the rows it was calculated from:

Pivot										°		
? Cre	eate a pivot t	able	to summariz	e the sele	cted co	olumns.						
Columi	ns:	Mat	ch type									•
Rows:		Add	ed/Excluded									Ŧ
Values:		Clic	ks									•
Summa	arize by:	Sum	ı									•
Set nor	n-calculated:	Zero	)									▼
		✓ a	dd totals									
Total b	y:	Row	s and colum	ns								•
	l	√ a	llow drilldow	'n								
Data	Charact	ers	Warnings	Info	Con	nment	Details	5				
	x 5 rows	)) E						$\leftarrow$	$\bigcirc$ Pi $\rightarrow$ $\rightarrow$	ivot tabl		
Add	led/Exclude	d	(Empty)	Broad ma	atch	Exact r	natch	Phrase	match	Grand	Sum	
1 (Em	pty)		24913		0		0		0	)	2491	13
2 Add	led		0		223		1903		103	5	222	29
3 Excl	uded		0		26		632		C	)	65	58
E D	rilldown			d	ouble	-click					×	
Ê.⊕												
	Search terr	n		Match	type	Add	ded/Excl	uded	Clicks	Impr.	CTR	•
43	print at ho	ne p	lace cards	Broad	match	n Ado	Added		5	5	100.0	
232	place card			Broad	Broad match		Added		3	89	3.379	
485	size of plac	e ca	rds	Broad	match	n Ado	Added		1	7	14.29	
544	printable d	inne	r place carc	s Broad	match	n Ado	ded		3	2	150.(	
•											Þ	Ŧ

You can also select **Drilldown...** from the right click menu.

The following transforms allow drilldown:

- <u>Count</u>
- <u>Dedupe</u>
- <u>Ngram</u>
- <u>Pivot</u>
- <u>Unique</u>

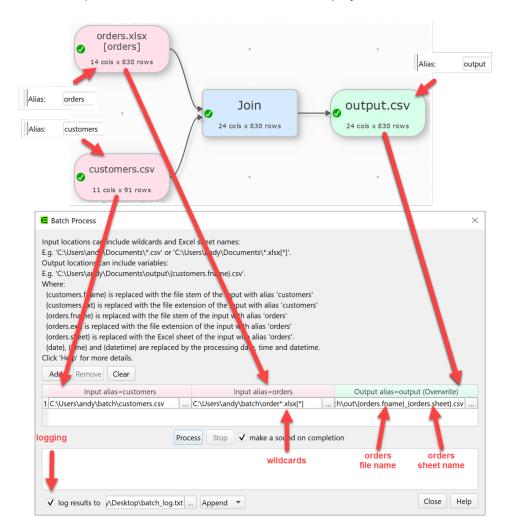

Note that enabling drilldown slows down processing and requires more memory.

See also:

• Video: How to drilldown into data

## 2.20 Batch processing

To apply the current .transform file to multiple input files/sheets select **File>Batch Process...** . The **Batch Process** window will appear with a column for each input item and a column for each output item. The **Alias** for each item is displayed in the column header.

#### Note:

- All input and output items must have an alias.
- An output item can't have the same alias as another output or input item.
- Disconnected input and output items are not shown.
- Output items with **Write mode**=Disabled are not shown.

Click **Add** to add a new processing row.

Click **Remove** to remove the selected processing row(s).

Click **Clear** to remove all processing rows.

Check **clear 'Append' outputs before first append** if you want to clear output files you are appending to before the first append.

Check **log results to** if you want to log the results to a text file. Set the file location and set the write mode to **Overwrite** or **Append**. You can use {datetime}, {date} and {time} in the file location.

In the input column(s) you can use * and ? wildcards for file name stems, file extensions and Excel sheet names. E.g.:

Input	Description
/Users/andy/Documents/*.csv	All files with extension .csv in the Documents folder
/Users/andy/Documents/d?.csv	All the files with name 'd' plus a single character in the Documents folder
/Users/andy/Documents/data.xlsx[* ]	All the sheets in data.xlsx in the Documents folder
/Users/andy/Documents/*.xlsx[data *]	All the sheets beginning with 'data' in all the .xslx files in the Documents folder

Note:

- If there is more than 1 input column on a row that specifies multiple files or sheets, then an output will be created for <u>each possible permutation of input files/sheets</u> in the row. E.g. 3 input files from column 1 x 4 sheets from column 2 = 12 outputs to process.
- Excel sheet names are not case sensitive.
- You cannot use wildcards for folder names.
- Batch processing will ignore files in sub-folders. Add them as extra rows.
- All the files input to an input item or output from an output item should be the same file type as the original.

In the output column(s) you can use the <u>file name variables</u> to dynamically change output file names based on input file names.

You can write to multiple sheets of an Excel file.

This example shows using a wildcard for the input file name and sheet and file name variables to set the output file name based on the input file with alias sales:

Input alias=sales		Output alias=output (Overwrite)		
1 C:\Users\andy\batch*.xlsx[*]		C:\Users\andy\batch\output\{sales.fname}.xlsx[{sales.sheet}]		

But make sure to set the corresponding output Write mode=Overwrite/Sheet.

Click **Process** to start processing the rows.

Click **Stop** to stop processing the rows.

Check **make a sound on completion** if you want to play a sound when all processing is finished.

Click **Close** to close the window.

Note:

- Whether an output file is created, overwritten or appended to depends on the **Write mode** of the output item.
- We recommend you output to a different folder than the one the input files are in.

See also:

- Video: Batch processing
- Batch processing examples
- <u>Command line arguments</u>

### 2.21 Command line arguments

Easy Data Transform accepts the following command line arguments:

Argument	Description
<file name=""></file>	The .transform file to open at start-up.
-build	Output the Easy Data Transform build time and date.
-cli	Close the application once any processing on the opened file is complete.
-log <location></location>	Appends the command line output to the file at <location>cli must also be set.</location>

Argument	Description
-file <alias>=<location></location></alias>	Sets the input or output file with the given alias to the location (path) specified. Input Excel files should include the sheet name, e.g. file.xlsx[sheet]. Output Excel files may optionally include a sheet name. The file type should be the same as the original.
-new_window	Don't load the last opened .transform file, even if <b>open previous file at start-up</b> is checked in <b>Preferences</b> .
-verbose	Output additional information to the terminal. Useful for debugging problems.
-version	Output the Easy Data Transform version number.

This allows you to run Easy Data Transform from the Mac Terminal or a script. For example:

To run /Users/andy/Documents/myfile 1.transform with the output with alias output1 output instead to /Users/andy/Documents/data1.csv:

```
/Applications/EasyDataTransform.app/Contents/MacOS/EasyDataTransform
'/Users/andy/Documents/myfile 1.transform' -file
'output1=/Users/andy/Documents/data1.csv' -cli -verbose
```

To run/Users/andy/Documents/myfile2.transform with the input with alias input1 input instead from sheet sheet1 of /Users/andy/Documents/data 2.xlsx:

```
/Applications/EasyDataTransform.app/Contents/MacOS/EasyDataTransform
/Users/andy/Documents/myfile2.transform -file
'input1=/Users/andy/Documents/data 2.xlsx[sheet1]' -cli -verbose
```

Use wildcards to transform multiple files in a folder:

```
for f in in*.csv;
do /Applications/EasyDataTransform.app/Contents/MacOS/EasyDataTransfo
rm '/Users/andyb/Dropbox/cli/cli.transform' -file cli-in=$f -file
cli-out=out-$f -cli -verbose; done
```

Use <u>file name variables</u> to dynamically change output file names based on input file names.

You can also use the Mac 'open' command:

```
open /Applications/EasyDataTransform.app --
args /Users/andy/Documents/myfile\ 1.transform -file
output1=/Users/andy/Documents/data1.csv -cli
```

```
open /Applications/EasyDataTransform.app --
args /Users/andy/Documents/myfile2.transform -file
'input1=/Users/andy/Documents/data 2.xlsx[sheet1]' -cli
```

But note that no command line output is shown if you use 'open'.

Put single quotes (') around any arguments with spaces or a backslash (\) in front of each space (as shown in the examples above).

Input and Output items are referenced by their Alias field value.

	output.csv
Ļ	⑦ Output to file.
Y	vrite header
1	Alias: output

If you are using relative (rather than absolute) paths for input or output files, these will be relative to the folder the current working folder.

If you are using wildcards, then it is usually a good idea to output to a different folder to the one that you are inputting from.

Select **File>Command Line...** to show sample command line text which you can copy and modify. It will also warn you of potential issues.

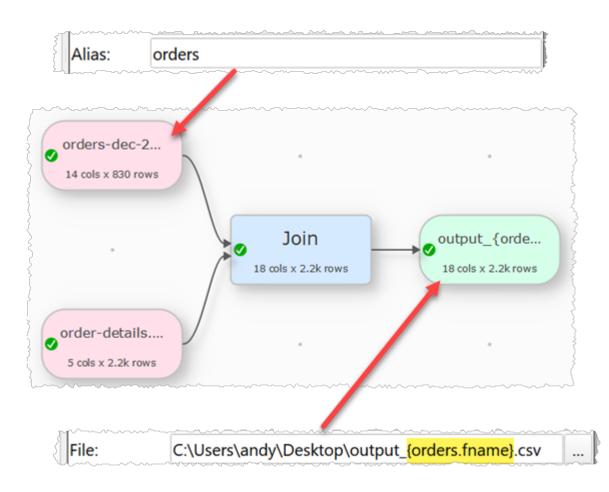

To run on a schedule, call the command line interface (or a script file that calls the command line interface) from a scheduling program, such as launchd.

See also:

- Batch processing
- Run jobs on a schedule

#### 2.22 File name variables

You can dynamically change the name of an output file based on input file names using file name variables. For example, if the input file with alias orders has file name orders_dec_2022.csv, then setting the output filename to output_{orders.fname}.csv will write to output_orders_dec_2022.csv.

You can also include dates and times in your output file names.

Output variables	Meaning	Example
<pre>{<input alias=""/>.fname}</pre>	The name of the input file being processed with the corresponding alias.	<pre>If the input with alias orders is using file /Users/andy/Documen ts/orders_2020.csv then {orders.fname} is replaced with orders_2020.</pre>
< <input alias=""/> .ext}	The extension of the input file being processed with the corresponding alias. Does not include the '.'.	If the input with alias orders is using file /Users/andy/Documen ts/orders_2020.csv then {orders.ext} is replaced with value csv.

<pre>{<input alias=""/>.sheet}</pre>	The sheet of the input file being processed with the corresponding alias (Excel only).	<pre>If the input with alias orders is using file /Users/andy/Documen ts/orders_2020.xlsx with sheet Sheet1 then {orders.sheet} is replaced with value Sheet1.</pre>
{ <input alias&gt;.folder}</input 	The folder (directory) of the input file being processed with the corresponding alias. Does not include the final /.	<pre>If the input with alias orders is using file /Users/andy/Documen ts/orders_2020.csv then {orders.folder} is replaced with /Users/andy/Docum ents.</pre>
<pre>{<input alias=""/>}</pre>	The name of the input file (plus an underscore and the sheet name, if an Excel file) being processed with the corresponding alias.	If the input with alias orders is using file /Users/andy/Documen ts/orders_2020.csv then {orders} is replaced with value orders_2020. If the input with alias orders is using file /Users/andy/Documen ts/orders_2020.xlsx with sheet Sheet1 then {orders} is replaced with value orders_2020_Sheet1.
{date}	Date processing was carried out in year_month_day format.	2020_04_18
{time}	Time processing was carried out in hours_minutes_seconds_milli seconds format.	15_21_56_599
{datetime}	Date/Time processing was carried out in year_month_day_hours_minu	2020_04_18_15_21_56_5 99

	tes_seconds_milliseconds format	
{version}	The Easy Data Transform version number	v1_39_0

File name variables can be used for output file names set in the **Right** pane, in <u>batch</u> <u>processing</u> or through <u>command line arguments</u>.

#### 2.23 .transform files

.transforms file are stored in a simple XML format. So you can edit them with a standard text editor. However we recommend you make a copy first.

The results of transformations are not stored in the .transform file, and are recalculated whenever you **File>Open...** the file.

The contents of Input and Output files are <u>not</u> stored in the .transform file, only their locations. These locations are stored as 'absolute' locations, so you can move the .transform file without changing the locations of the Input and Output files.

If you open a .transform file in a different location from that in which it was saved and it can't find Input and Output files at the expected location it will look for them in the same location relative to the old .transform file. This allows you to easily move .transform files to different locations and computers if you keep the Input and Output files in the same relative location (e.g. in the same folder as the .transform file). This even works between Windows and Mac (and vice versa),

Example:

- mytransform.transform is in C:\Users\andy\Documents\ on Windows and uses Input file MyData.csv in sub-folder MyData (C: \Users\andy\Documents\Data\MyData.csv).
- mytransform.transform is moved to /Users/Bob/Documents/EDT on a Mac.
- When mytransform.transform is opened it will look for MyData.csv in /Users/andy/Documents/Data.
- If it can't find that it will look for MyData.csv in sub-folder MyData (/Users/Bob/Documents/EDT/Data/MyData.csv).

If you paste in data **From Clipboard** this is stored in the .transform file. We don't recommend you do this for large datasets as XML is not very efficient for storing large amounts of data.

#### 2.24 Memory usage

Easy Data Transform keeps all the data in memory for maximum performance. You can track the current memory usage in the **Status** bar.

Memory usage: 2% of 10GB 📄 📮 🔆	Email us questions/feedback

Set **Maximum memory usage** in **Preferences** to the maximum amount of memory you want the Easy Data Transform process to use. If this is exceeded, you will be asked if you want to allocate more memory. It is generally not recommended to set this to more than the system RAM, otherwise Easy Data Transform will start using virtual memory (paging between RAM and disk) which is slow. The operating system can also crash or freeze if all the available virtual memory is used.

If **Optimize processing for** is set to **Minimum memory use** in **Preferences** then memory compression techniques are used to try to reduce the amount of memory required. This is generally recommended, as not using memory compression may use up all the RAM available and start using virtual memory to page between RAM and disk, which is likely to be a lot slower than the compression overhead.

### 2.25 Data security

As Easy Data Transform can potentially read or write any file on your computer, to which you have read/write permission, you need to be careful not to run .transform files of unknown provenance until you have checked them. Otherwise they could accidentally or maliciously read or write files that you don't wish to be accessed. To this end we recommend:

- Not setting Opening a .transform with auto run to Leave auto run enabled in Preferences>General, so that you can check any .transform files you aren't sure about, before running them.
- Setting **Block input from files with extensions** in **Preferences>Input Extensions** to any file extensions of any file types that Easy Data Transform shouldn't be reading from.
- Setting **Block output to files with extensions** in **Preferences>Output Extensions** to any file extensions of any file types that Easy Data Transform shouldn't be writing to.

### 2.26 Portability

By default Easy Data Transform stores your preferences in macOS Library/Preferences. However you can store your preferences in an easydatatransform.ini file in the same folder as the Easy Data Transform .app file. This means you can install Easy Data Transform on a device without admin access. It also allows you to store everything on a portable device, such as a USB memory stick. You can even move your portable device between Windows and Mac computers.

To use Easy Data Transform portably:

- Install Easy Data Transform into an appropriate folder on the portable device. Make sure you have write permission to the folder.
- Start Easy Data Transform.
- Open the **Preferences** window.
- In the General tab set the Store these preferences in field to portable .ini file.
- Click OK.
- You may also wish to copy your .transform files to the portable device.

If you change the folder your portable version is installed in (e.g. you install a new version to a different folder) you should copy across your easydatatransform.ini file to the new folder.

If you move your portable device from one computer to another (e.g. Windows to Mac) the path of files may change (e.g. from D:\my_usb_key\my_transform.transform.transform to /Volumes/my_usb_key/my_transform.transform). Easy Data Transform will try to be intelligent about handling these changes of path by:

- storing recent .transform file paths as relative rather than absolute paths
- by treating relative .transform paths as relative to the Easy Data Transform .app file.

It is possible to have Windows and Mac versions of Easy Data Transform on the same device sharing a single easydatatransform.ini file and common input, output and .transform files. Just make sure you install the Windows .exe and Mac .app into the same folder. We also recommend that they are the same version of Easy Data Transform.

If you have problems installing Easy Data Transform to a USB key see <u>Mac Install</u> <u>Troubleshooting</u>.

For the purposes of licensing, installing to a USB key, or other portable device, counts as one of your 3 allowed installs.

<u>Note</u> If you install Easy Data Transform Windows .exes or Mac .apps into 2 different folders and set them to use .ini files, they will each store their preferences in their own .ini file.

#### 2.27 Keyboard shortcuts

Using keyboard shortcuts can improve your productivity. If you are using Easy Data Transform a lot we suggest you find the time to learn at least some of them. The following keyboard shortcuts are available for the Mac version of Easy Data Transform:

Кеу	Shortcut	Action
A	Cmd+A	Select all in <b>Center</b> pane.
В	Cmd+B	Show the <b>Batch Process</b> window.
С	Cmd+C	Copy selected data with header from the <b>Right</b> pane.
	Cmd+Shift+C	Copy selected data without header from the <b>Right</b> pane.
D	Cmd+D	Duplicate the selected branch in the <b>Center</b> pane.
F	Ctrl+F	Find items that match a search term in the <b>Center</b> pane.
	Ctrl+Cmd+F	Toggle setting <b>Right</b> pane item to fullscreen. Only works if 1 item in <b>Right</b> pane.
L	Option+I	Input From File.
	Option+Shift+I	Input From Clipboard.
К	Cmd+K	Search transforms by keyword.
L	Cmd+L	Toggle the <b>Log</b> pane visibility on/off.
М	Cmd+M	Toggle cursor magnification for <b>Center</b> pane on/off.
Ν	Cmd+N	New .transform file.
0	Cmd+0	Open .transform file.
	Cmd+Shift+O	Show the <b>Open Recent</b> window.
	Option+0	Output To File.
R	Cmd+R	Run unprocessed items [4].

Кеу	Shortcut	Action
	Cmd+Shift+R	Run selected items [4].
S	Cmd+S	Save .transform file.
т	Cmd+T	Toggle two screen mode on/off
U	Cmd+U	Toggle user interface between light and dark themes (if available).
Z	Cmd+Z	Undo
	Cmd+Shift+Z	Redo
Space	Space	Show the <b>Value</b> window for the current value in the <b>Right</b> pane.
Backspace	Backspace	Delete selected item(s) in <b>Center</b> pane.
	Cmd+,	Toggle the <b>Timing Profile</b> on/off.
,	Cmd+,	Show <b>Preferences</b> window.
=	Cmd+=	Zoom <b>Center</b> pane so all items fit.
+	Cmd++	Zoom <b>Center</b> pane in.
-	Cmd+-	Zoom <b>Center</b> pane out.
[	Option+[	Move keyboard focus to <b>Center</b> pane.
]	Option+]	Move keyboard focus to <b>Right</b> pane.
١	Cmd+\	Stop processing.
Left arrow	Cmd+Left arrow	Move <b>Center</b> pane selection from item to highest[1] item that inputs to it.

Кеу	Shortcut	Action
Right arrow	Cmd+Right arrow	Move <b>Center</b> pane selection from item to highest[1] item that it outputs to.
Up arrow	Cmd+Up arrow	Move <b>Center</b> pane selection from item to highest[1] sibling[3].
Down arrow	Cmd+Down arrow	Move <b>Center</b> pane selection from item to lowest[2] sibling[3].
19	Cmd+1 Cmd+9	Select input item 1 to 9 (based on height in <b>Center</b> pane).
	Cmd+Shift+1 Cmd+Shift+9	Select output item 1 to 9 (based on height in <b>Center</b> pane).
F1	Fl	Show help.
F5	F5	(Re)process all [4].
F8	F8	Show options and data in the <b>Right</b> pane.
F9	F9	Show only options in the <b>Right</b> pane.
F10	F10	Show only data in the <b>Right</b> pane.

[1] Highest=nearest the top of the **Center** pane.

[2] Lowest=nearest the bottom of the **Center** pane.

[3] Two items are considered siblings if they have inputs from the same item(s) or they both have no inputs.

[4] If Run>Auto Run is unchecked.

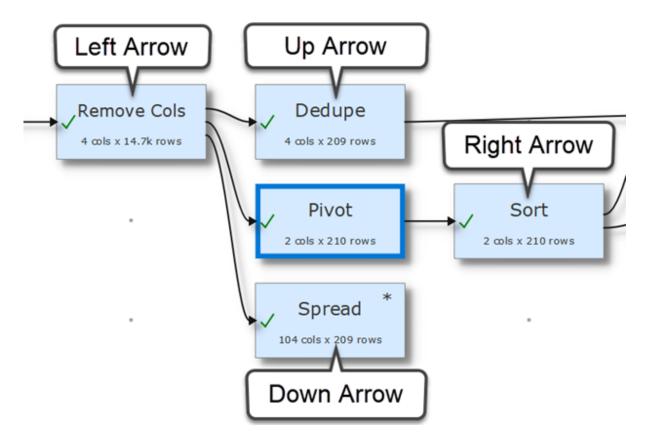

You can also use the keyboard to add transforms in the **Center** pane. Just select the item(s) you want to add the transform to and start typing the name. Only eligible transform that contain the typed letters will be displayed (spaces are ignored).

For example, to add the **Rename Cols** transform an existing Input item:

- select the input items
- type ren
- press the Return key

If you want to see a list of all the transform names, press the Space key before you start typing. You can use the Del or Backspace key to undo letters typed.

You can quickly change selection in the Center pane using arrow keys with the Cmd key.

If you are zoomed in you can scroll the **Center** pane by pressing the Shift key and dragging the canvas.

#### 2.28 Dark mode

Select **View>Toggle UI Theme** (or the corresponding status bar button) to swap between light and dark user interface themes. You can also change the **Center** color scheme in the **Colors** tab of the **Preferences** window.

• • •					to Oryx Digital Ltd)	
	□ Q €	ର୍ # ⊗	▼ How Do I?

How do I?

# How do I?

## 3 How do I?

#### **3.1** Add a transform between existing items

To add a new transform between existing items (e.g. between 2 already connected transforms) see <u>connections</u>.

#### 3.2 Add metadata to a dataset

You can add meta data to an input dataset by setting the **Meta info** field. See <u>meta</u> <u>information</u> for more information.

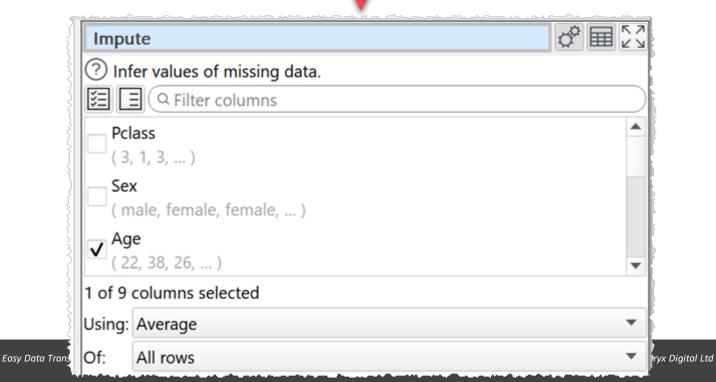

10k.csv		് ്	
Input	from file.		
File:	D:\EDT data\CSV\10k.csv		
	Delim		-
Ignore:	o row(s)		· · · · · · · · · · · · · · · · · · ·
	E Meta Information	$\times$	
	(f(File Dath) f(Current DataTime)	Clear	
	\$(FilePath) \$(CurrentDateTime)	Clear	
	Insert: <select></select>	•	
	OK Cancel	Help	
Meta info	o: At start		•
Alias:	10k		
Data	Characters Warnings (i) Info Comment	Detail	s
14 cols x	10,001 rows		🕑 Read
▷ 🛱		$\overline{\uparrow}$	$\downarrow \downarrow$
C	Region		C A
1	D:\EDT data\CSV\10k.csv 2022-12-05T09	30:2	9

### 3.3 Add missing data values

You can add missing values based on the average (mean), median or mode of non-empty values in the same column using the **Impute** transform.

For example you can add missing ages for Titanic passengers based on the average age supplied for the other passengers:

	Pclass	Sex	Age	SibSp	Parch	^
21	2	male	35	0	0	
22	2	male	34	0	0	
23	3	female	15	0	0	
24	1	male	28	0	0	
25	3	female	8	3	1	
26	3	female	38	1	5	
27	3	male		0	0	
28	1	male	19	3	2	
29	3	female		0	0	
30	3	male		0	0	
31	1	male	40	0	0	

See the Impute transform documentation for more details.

See also:

- Video: How to impute missing data
- <u>Replace empty values</u>
- Profile a dataset

#### 3.4 Add or remove a header

To add or remove a header just check or uncheck the **has header** checkbox for the appropriate input item.

vaccinati	on.csv			0 ¢°	K 2 12 3
File:	/Users/andyb/D	esktop/	vaccination.cs	v	
Type:	Delimited text				٥
Delimiter:	Automatic				٥
Quoting:	Automatic				٥
Encoding:	Automatic				٥
Ignore:	First 0 row(s)				1
	<ul> <li>simplify white</li> <li>ignore empty</li> <li>watch file</li> </ul>				
Meta info:	Not added				٥
Alias:	vaccination				
Data	a Warnings	Info	Comment	Results	
3 cols x 5	780 rows				
C B	$\square$		Show first	10 rows	٥
Count	ry time bcg_	vacc	>		-

You can also make the first row of your dataset into a header using the <u>Header</u> transform.

### 3.5 Change a connection

To change a connection see <u>connections</u>.

## 3.6 Change encoding

When Easy Data Transform inputs a text file (e.g. a CSV file) it will make a guess at the encoding. You can explicitly set the encoding by selecting an <u>input</u> item and changing **Encoding** from **Automatic** to one of the other encodings in the **Right** pane.

vaccinati	on.csv 🕜 🔗	К Л И У			
File:	/Users/andyb/Desktop/vaccination.csv				
Type:	Delimited text	٢			
Delimiter:	Automatic				
Quoting:	Automatic				
Encoding:	Automatic	٢			
Ignore:	First 0 row(s)	\$			

Similarly you can also set the encoding of a text file output by selecting the <u>output</u> item and changing **Encoding** in the **Right** pane.

output.csv			?	¢	К Л 4 Ч
File:	/Users/andyb/Desktop/output	.csv			
Type:	Delimited text				٢
Delimiter:	Comma (,)				٢
Quoting:	As needed				٢
Line endings:	Automatic				٢
Encoding	UTF-8				٢
(	🖌 Byte Order Mark				

See also:

<u>Video: How to change CSV file text encoding</u>

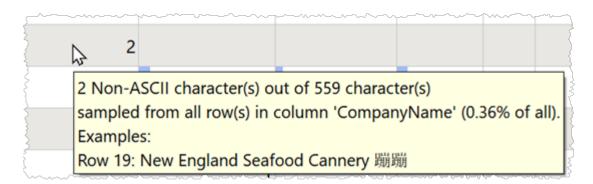

## 3.7 Clean a dataset

Data is often 'dirty' and needs to be cleaned up before further processing. You can quickly find unwanted characters by looking in the **Characters** tab of the **Right** pane to see what types of characters occur in which columns.

Data Ch	aracters	Warn	ings	(i) Info	Commer	nt Det	ails					
Sample: All 2	9 rows 🔻	✓ show	w bars									
	Supp	lierID	Com	panyName	Contac	tName	Cont	actTitle	Address	City	Region	PostalCode
Uppercase				80		60		61	6	4 33	3 95	1
Lowercase				408		293		4 <mark>28</mark>	34	7 18	5 24	ļ
Digit		49							8	1		12
Dot				g				2	1	2		
Colon												
Apostrophe				e	;					2		
Dash				2	2	1				5 2	2	
Forward Sla	sh											
Other				з						1		
Non-ASCII				2	2							
Space				51		32		32	7	4 2	2	
Leading Spa	ace			1								
Trailing Spa	ce					1						
Double Spa	ce			1								

Note that some of these categories are non-exclusive. For example: a space might be counted as a space, whitespace and a leading space, and a symbol might also be a non-ASCII character.

Hover over a cell for more details.

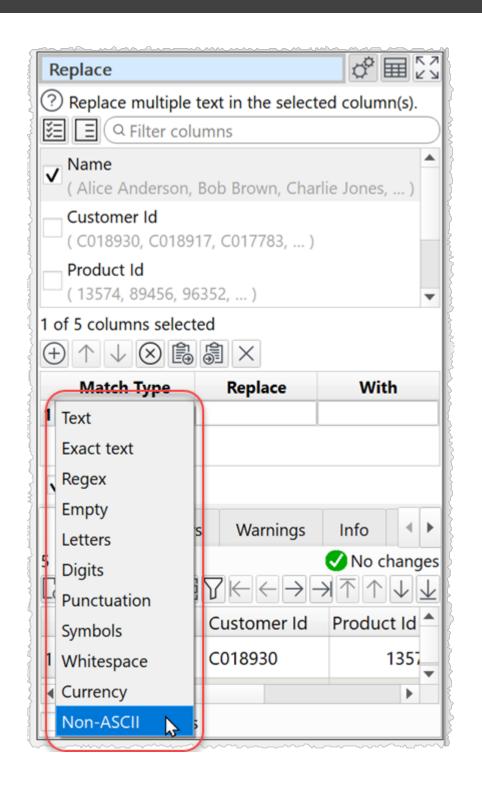

You can turn the colored bars off.

	Data	Characters		Warn	ings	() Info
~	Sample:	All 29 ro	ws 🔻	show	v bars	
1			Suppl	ierID	Comp	anyName
	Upperc	ase				80
	Lowerca	ase				408
S	Digit			49		

And you can restrict it to sampling only a subset of rows for improved speed in large datasets.

Data	Characters	Wa	arnings	(i) Info
Sample:	1,000 rows		✓ show	bars
	10,000 rows	h3	ountry	Item Type
Upperc	100,000 rows		1,252	1,250
Lowerca	All 500,000 rov		7,267	

You can use the **Characters** tab in conjunction with the <u>Replace</u> and <u>Whitespace</u> transforms to quickly clean your data. **Replace** can easily remove non-ASCII, symbols etc by replacing them with nothing:

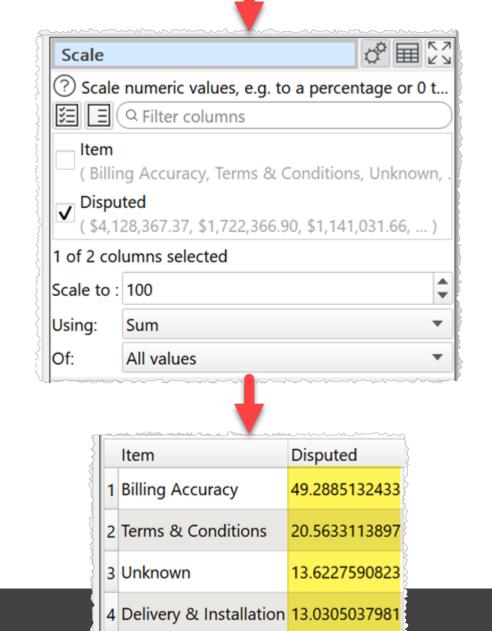

See also:

- Video: How to clean data
- Add missing data values
- Profile a dataset

## 3.8 Convert to percentages

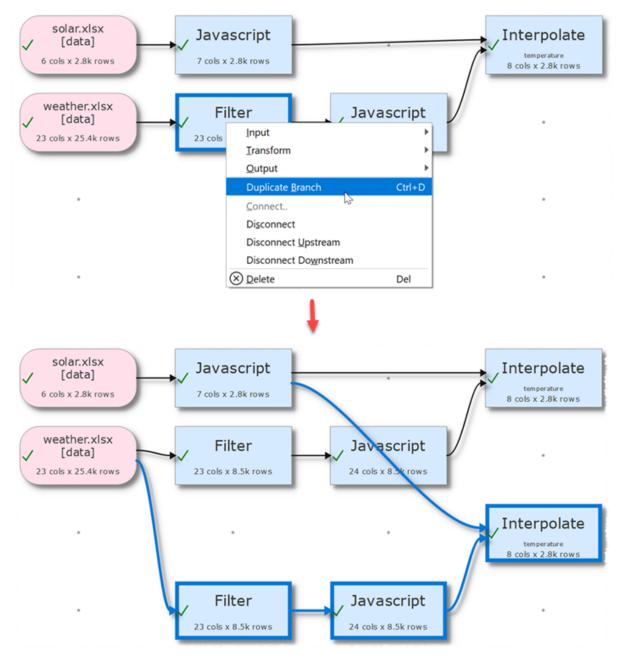

You can convert to percentages using the <u>Scale</u> transform.

	Item	Disputed
1	Billing Accuracy	\$4,128,367.37
2	Terms & Conditions	\$1,722,366.90
3	Unknown	\$1,141,031.66
4	Delivery & Installation	\$1,091,424.82
5	Service Delivery	\$238,914.81
6	Technical Issues	\$53,816.33

## **3.9** Duplicate a series of transforms

To duplicate multiple items in the **Center** pane (e.g. a sequence of transforms) right click on the first item and select **Duplicate Branch**.

#### 3.10 Dedupe a dataset

There are 2 transforms for removing duplicate rows from datasets:

• <u>Dedupe</u> removes duplicate rows, keeping only the first row in each group that it considers to be duplicates of each other

• <u>Unique</u> creates a single aggregate row from each group that it considers to be duplicates of each other

Dedupe is simpler. Unique has more flexibility.

### **Using Dedupe**

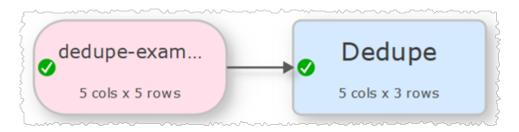

To keep only the first row with each **Customer Id** from this dataset:

Name	Customer Id	Product Id	Cost	Date
1 Alice Anderson	C018930	13574	29.95	01/10/2020
2 Bob Brown	C018917	89456	10.55	01/10/2020
3 Charlie Jones	C017783	96352	19.95	02/10/2020
4 Robert Brown	C018917	98526	10.00	02/10/2020
5 Charles Jones	C017783	28746	25.00	03/10/2020

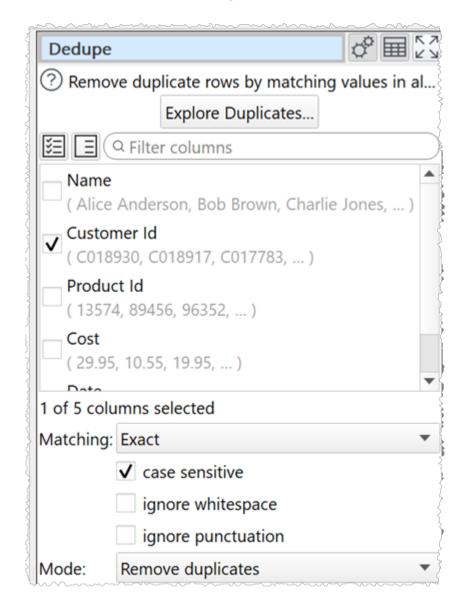

To get this dataset:

Name	Customer Id	Product Id	Cost	Date
1 Alice Anderson	C018930	13574	29.95	01/10/2020
2 Bob Brown	C018917	89456	10.55	01/10/2020
3 Charlie Jones	C017783	96352		02/10/2020

Drag the dataset file onto the **Center** pane of Easy Data Transform. Then click the **Dedupe** transform in the **Left** pane.

Then check the **Customer Id** column in the **Right** pane.

Only the first row with each **Customer Id** is kept. Use <u>Sort</u> if you want to change the order before the **Dedupe** transform.

If you only want to remove rows with the same **Customer Id** and **Product Id**, check both the **Customer Id** and **Product Id** columns.

If you want to use <u>fuzzy matching</u> to also remove rows that are similar, but not identical, set **Matching** to **Fuzzy**.

To see what rows will be removed and experiment with different options, click the **Explore Duplicates...** button.

Explore Duplicates				— C	]	$\times$			
Columns to match:		Mate	ching: E	xact		Ŧ			
Filter colu	imns			case sens	itive				
Name	Bob Brown, Charli	▲ e lone		ignore wi					
Customer Id ( C018930, C0189				ignore pu					
Product Id									
1 of 5 columns select	ed								
▶ □ Fou	nd 3 non-duplicat	es and 2 duplic	ates in	<0.1 second	ls				
Data Summary									
hide unchecked o	olumns 🗌 hide ı	rows with no du	uplicates	;	J	· 1			
Name	Customer Id	Product Id	Cost	Date		Grou			
1 Alice Anderson	C018930	13574	29.95	01/10/202	0				
2 Bob Brown	C018917	89456	10.55	01/10/202	0				
3 Robert Brown	C018917	98526	10.00	02/10/202	0				
4 Charlie Jones	C017783	96352	19.95	02/10/202	0				
5 Charles Jones	C017783	28746	25.00	03/10/202	20				
•						Þ			
				ОК	C	ancel			

Note that **Dedupe** takes account of whitespace. So you might need a <u>Whitespace</u> transform before the **Dedupe** transform.

See also the <u>Dedupe</u> documentation.

### **Using Unique**

To aggregate all rows with the same **Customer Id**:

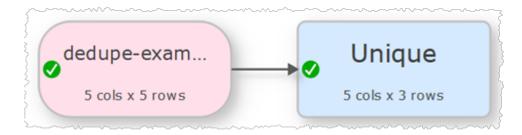

Name	Customer Id	Product Id	Cost	Date
1 Alice Anderson	C018930	13574	29.95	01/10/2020
2 Bob Brown	C018917	89456	10.55	01/10/2020
3 Charlie Jones	C017783	96352	19.95	02/10/2020
4 Robert Brown	C018917	98526	10.00	02/10/2020
5 Charles Jones	C017783	28746	25.00	03/10/2020

To get this dataset with:

- The first Name for that Customer Id
- A comma separated list of **Product Ids** for that **Customer Id**
- The total Cost for that Customer Id
- The last Date for that Customer Id

Name	Customer Id	Product Id	Cost	Date
1 Alice Anderson	C018930	13574	29.95	01/10/2020
2 Bob Brown	C018917	89456,98526	20.55	02/10/2020
3 Charlie Jones	C017783	96352,28746	44.95	03/10/2020

Drag the dataset file onto the **Center** pane of Easy Data Transform. Then click the **Unique** transform in the **Left** pane (if you can't see **Unique**, then check **show advanced** is checked in the **Left** pane).

Then set the **Unique** options as shown below:

Unique	\$ ■ 🔀						
⑦ Aggregate rows with unique values in selected c							
Column	Option						
Name	Keep first						
Customer Id	Keep unique 🔹						
Product Id	Concat 🔹						
Cost	Sum 💌						
Date	Keep last 🔹						
Set All	▼ to Keep unique ▼						
'Keep unique' for 1 of 5 columns							
Concat delimiter: ,							
add	count column						

One aggregated row is created for each **Customer Id**. Use <u>Sort</u> if you want to change the order before the **Unique** transform.

If you only want to create a new aggregate row for rows with the same **Customer Id** and **Product Id**, set both the **Customer Id** and **Product Id** columns to **Keep unique**.

Note that **Unique** takes account of whitespace. So you might need a <u>Whitespace</u> transform before the **Unique** transform.

See also the <u>Unique</u> documentation.

See also:

- <u>Video: How to remove Excel duplicates</u>
- Video: How to merge rows in Excel

## **3.11** Find the difference between dates/datetimes

You can calculate the number off days difference between two dates using the <u>Calculate</u> transform. For example:

		_		<u> </u>							
		- And	St	art		End	l				
			1 31	1/12	2/2019	7/1,	/2020				
			2 <mark>0</mark> ′	1/0 [.]	1/2021	15/	1/2021				
			3 07	7/0'	1/2021	8/1,	/2021				
~~~~~~	····-	~(		~~~~~		~~~~~			~~~~		
Calcu	late							¢	¢ [Ħ	<pre></pre>
? Perf	Perform calculations on 1 or 2 columns to creat										
Operati	ion: - Subtract 💌										
Value 1:	End 💌										
Value 2	type	e: C	olun	nn							•
Value 2:		S	tart								•
	~~~		~~~~	· · · · ·		· · · · · ·		_^		~~~	~~
	Start			End		End-Sta					
	13	31/1	2/20	19	7/1/20	20	7				
	2 0	01/0	1/20	21	15/1/2	021	14				
	3 0	07/0	1/20	21	8/1/20	21	1				
	1 m m m m				10 10 10 10 10 10 10 10 10 10 10 10 10 1						

You can convert a datetime into a date using a transform such as Extract.

Alternatively, you can calculate the difference between two dates or datetimes using Date objects in the <u>Javascript</u> transform.

Date format	Description
<pre>new Date(year, month, day, hours, minutes, seconds, milliseconds)</pre>	Specified date and time specified as numeric parameters (January is month 0!).
new Date(text date)	Date and time specified as text.
new Date(milliseconds)	Milliseconds after 1st January 1970.
new Date()	Current date and time.

Notes:

- A text date should be in <u>yyyy-MM-dd format</u>.
- A Date object always includes a time. If no time is set, then the time is assumed to be midnight GMT.
- One and two digit years will be interpreted from 1900.

#### **Examples**

To calculate the number of milliseconds between a date in the 'date' column and 31st Dec 2000:

return new Date( \$(date) ) - new Date( "2000-12-31" );

Or:

```
return new Date( $(date) ) - new Date( 2000, 11, 31 );
```

To calculate the difference between datetimes in the 'start' and 'end' columns in hours:

```
return ( new Date( $(end) ) - new Date( $(start) ) ) / ( 60 * 60 *
1000 );
```

To calculate how many days ago 'date' occurred (rounded down):

```
return Math.floor( ( new Date() - new Date( $(date) ) ) / ( 24 * 60 *
60 * 1000 ) );
```

For more information see the <u>Javascript documentation</u>.

## **3.12** Handle column name/order changes in inputs

If you have a .transform file that you want to run multiple input files through (perhaps with a different input file each month, via the <u>command line</u> from a script, or as a <u>batch process</u>) you need to be aware of differences in column name and column order in the input files.

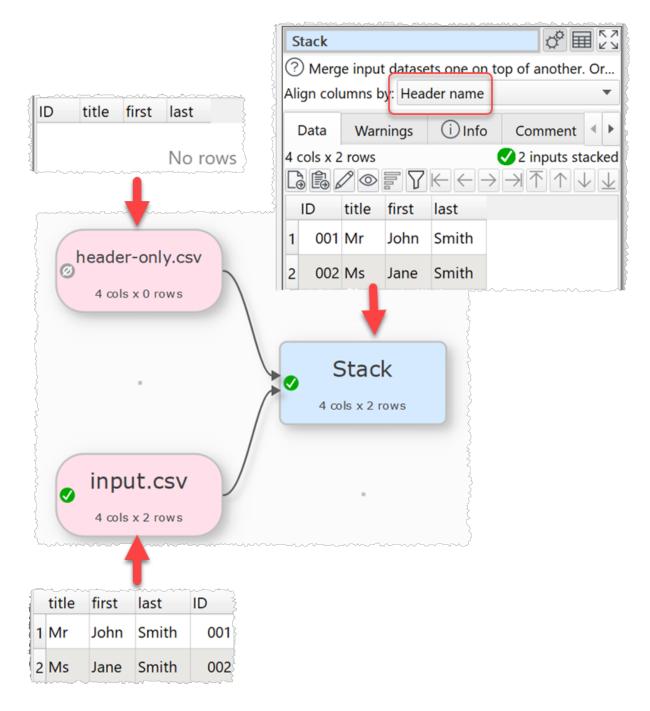

To change the file being used by an input, select the input item and change the file location in the **Right** pane (e,g, by clicking the '...' browse file button), rather than disconnecting the input and connecting a new one. Otherwise column-related parameters downstream will be reset.

#### Same columns in the same order, but with different names

Easy Data Transform references columns by their position (e.g. 3rd column from the left) not their column name. So differences in column names (e.g. first column is called "id" in input 1 and "UniqueID" in input 2) are not generally an issue. But you need to be careful if you are using the <u>Stack</u> transform with **Align columns by** set to **Header name**, as this will reorder columns by name. If you want to always output the same column names, regardless of the input column names, you should use a <u>Rename Cols</u> transform to set the names.

#### Same columns with the same names, but in a different order

If columns are in different orders in different input files (e.g. the "ID" column in the first column in input 1 and the last column in input 2) you need to put the input columns into a standard order before applying other transforms. You can so this using the <u>Stack</u> transform with **Align columns by** set to **Header name**. You can stack your input under a dataset with just the columns in the correct order (no data rows).

#### Same columns with different names, in a different order

Easy Data Transform can't handle this automatically. But you can create a new .transform and use <u>Reorder Cols</u> and/or <u>Rename Cols</u> transforms to output to a new file with the correct column names/ordering. You can then input this to the original .transform.

### 3.13 Handle datasets with many columns

Easy Data Transform can help you to easily remove or rename columns in datasets with large numbers of columns.

#### **Remove multiple empty columns**

If your dataset has a large number of empty columns you can remove them by checking **ignore empty columns** when you input it.

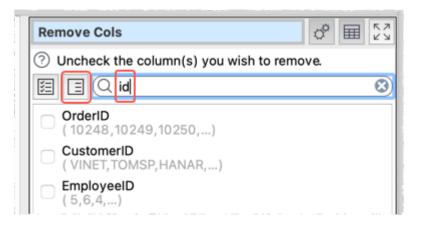

orders.xlsx[orders]							
⑦ Input from file.							
File:	ndyb/Dropbox/EDT_data/orders.xlsx[orders]						
Type:	Excel XLSX	٥					
Ignore:	First 0 row(s)	\$					
	✓ has header						
	✓ trim whitespace						
	✓ simplify whitespace						
	✓ ignore empty rows						
	<ul> <li>ignore empty columns</li> </ul>						
	watch file						

#### **Remove multiple columns**

To quickly remove a large number of columns using the <u>Remove Cols</u> transform, you can do it by filtering column names. For example, to remove the columns with name that contain "id":

- Add a Remove Cols transform.
- Type id into the filter field. All the columns whose names contain "id" should now be visible (not case sensitive).
- Click the **Unselect all** button.
- Click the **Clear** button.

All the columns whose names contain "id" should now be removed by the transform. You can repeat this process as often as needed.

#### **Rename multiple columns**

To quickly rename a large number of columns using the <u>Rename Cols</u> transform, you can do it using **Replace text**:

- Add a Rename Cols transform.
- Click the **Replace text** button.
- Enter the text you want to **Replace** and the text you want to replace it **With**. You can match as **Text**, **Exact text** or **Regex**, with **case sensitive** matching optional.
- Click **Apply** to make the change.
- Click Close.

Replace			Rename Cols	o	
Match type: Text 📀 Case sensitive		⑦ Rename column headers.       • • • • • • • • • • • • • • • • • • •			
Replace:	ID		Old name	New name	
With:	Id		OrderID	OrderId	
Preview:	Changes applied		CustomerID	CustomerId	
Apply		Close	EmployeeID	Employeeld	
14 cols x 830 rows			OrderDate	OrderDate	

See also:

• <u>Handle large datasets</u>

#### 3.14 Handle large datasets

Large datasets (e.g. with millions of rows) can slow down processing. If slow processing is a problem you can:

- Add a <u>sample</u> transform straight after the input and set **Rows** to pass through only the first 100 or so rows. Once you have completed all your transforms you can then **Disable sampling** to pass through all rows.
- Set **Maximum memory usage** to a higher value in the <u>Preferences window</u>, to ensure you don't run out of memory.
- Set **Optimize processing for** to **Minimum memory use** in the <u>Preferences window</u>, to reduce memory usage.

Uncheck Run>Auto Run to give yourself full control over processing.

or

- Check **Run>Auto Run** and:
  - Set **Right pane processing delay** in the <u>Preferences window</u> to a longer time (say 5 seconds) to ensure that changes aren't processed until you have finished making the changes.

o Set Write mode to Disabled in output files, until you are ready to write them.

10k.csv 14 cols x 10k rows Stack 14 cols x 110k rows 14 cols x 81.5k rows 15 cols x

You can check View>Timing Profile to see where the processing time is being spent.

#### See also:

- Handle datasets with many columns
- Manage a large number of Center pane items
- <u>Processing</u>

#### 3.15 Input a fixed width format file

To input data from a fixed width file see fixed width format.

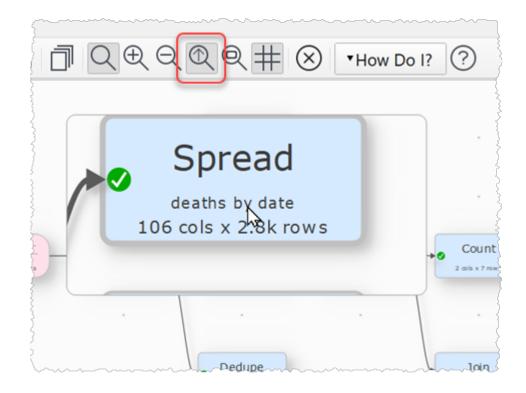

#### **3.16** Manage a large number of Center pane items

Large .transform files can have 100+ Input, Transform, Output and Note items in the **Center** pane. There are various techniques you can use to keep this manageable:

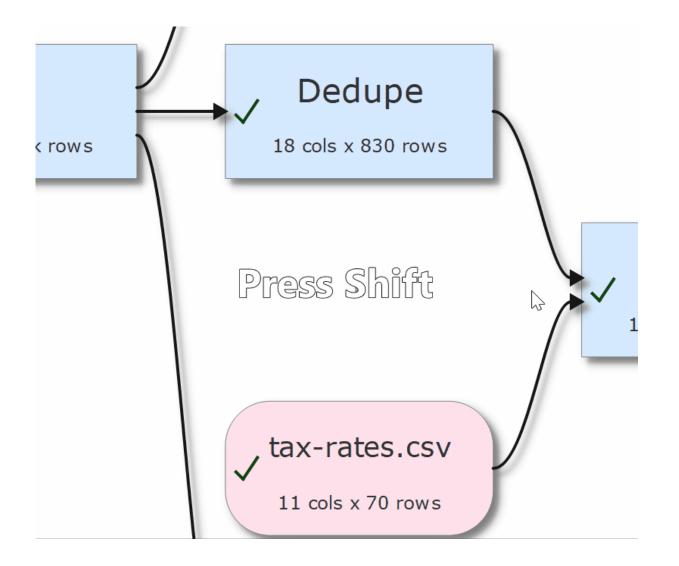

• Place items in conceptual groups with space bewteen. Use Note items to describe the purpose of the group.

- Try to avoid connections crossing items and other connections where possible.
- Set Edit>Snap To Grid on to make it easier to keep items neatly aligned.
- Select View>Show Tool Tips>Detailed, so that you can see detailed tooltips when hovering over an item.
- Add comments in item **Comment** tabs. You can see these in tooltips when you hover over the items. You can also select **View>Show Comments** to show them on items.
- Select View>Magnify Cursor to magnify items while zoomed back.

- Select View>Find Items to select items in the Center pane that match one or more search terms.
- Configure the mouse wheel zoom and pan behavior using the **Zoom wheel behavior** field of the **General** tab in the <u>Preferences</u> window.
- Hold down the Shift key and drag on the **Center** pane to scroll left/right/up/down.

See also:

• Handle large datasets

#### 3.17 Merge datasets

Easy Data Transform has two main options for merging two datasets. Stack and Join.

#### Stack datasets

If you want to merge the two datasets so they are one on top of another, use the <u>Stack</u> transform. For example, to Stack these two datasets:

	Name	ID	DOB
1	John Black	001	01/07/1966
2	Paul White	002	11/03/1973
3	Barry Green	003	30/12/1977
	-	╋	
ſ	Namo		DOP

	Name	ID	DOB
1	1 Jane Brown	004	03/11/1980
20/20/20 4	2 Jill Taupe	005	01/03/1981

To get this dataset:

Ĺ	Name	ID	DOB
1	John Black	001	1966-07-01
2	Paul White	002	1973-03-11
3	Barry Green	003	1977-12-30
4	ane Brown	004	1980-11-03
5	Vill Taupe	005	1981-03-01

- Drag the two dataset files onto the **Center** pane of Easy Data Transform.
- Select the two datasets using Cmd+click.
- Click the **Stack** transform in the **Left** pane.

The datasets are now stacked in the vertical order that the datasets are shown on the screen. The top dataset is shown first. You can swap the vertical positions of the datasets to change the order in which they are stacked.

If you want to stack column n of the first dataset above column n of the second dataset, set **Align columns by** to **Column number**.

If you want to stack columns by common <u>header names</u> (even if they aren't in the same order), set **Align columns by** to **Header name**.

If you want to stack a large number of files you can do it by using <u>batch processing</u> to write to an output item with **Write Mode**=Append.

## Join datasets

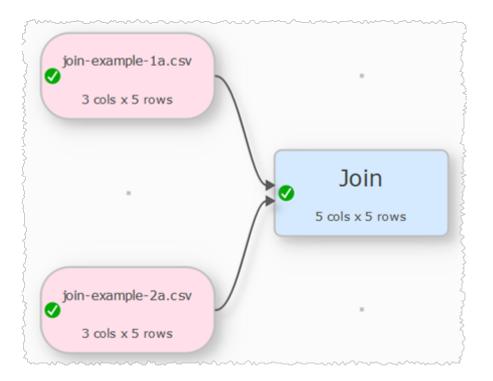

If you want to merge the two datasets side-by-side using a common ('key') column, use the <u>Join</u> transform. For example, to Join these two datasets:

	Name	ID	DOB		ID	Department	Level
1	John Black	001	1966-07-01	1	001	Engineering	1
2	Paul White	002	1973-03-11	2	003	Engineering	2
3	Barry Green	003	1977-12-30	3	004	Marketing	1
4	Jane Brown	004	1980-11-03	4	002	Sales	2
5	Jill Taupe	005	1981-03-01	5	005	Sales	3

By common ID value to get this dataset:

	Name	ID	DOB	Department	Level
1	John Black	001	1966-07-01	Engineering	1
2	Paul White	002	1973-03-11	Sales	2
3	Barry Green	003	1977-12-30	Engineering	2
4	Jane Brown	004	1980-11-03	Marketing	1
5	Vill Taupe	005	1981-03-01	Sales	3

- Drag the two dataset files onto the **Center** pane of Easy Data Transform.
- Select the two datasets using Cmd+click.
- Click the **Join** transform in the **Left** pane.

• Set both **Top key column** and **Bottom key column** to the common ('key') column.

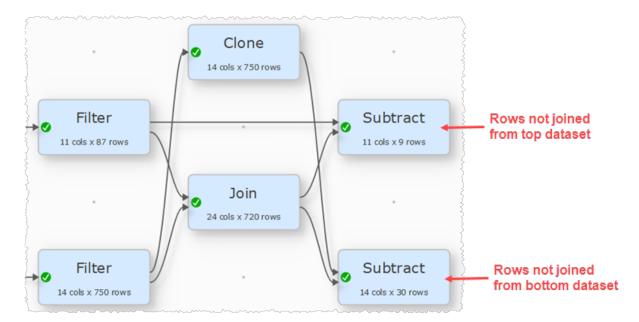

Join 🖉 🖬 🖸							
⑦ Merge 2 input datasets side by side using common (k							
(	Explore Keys						
Top key column:	ID 📀						
	include top non-matching rows						
Bottom key column:	ID 🕄						
	<ul> <li>include bottom non-matching rows</li> <li>case sensitive</li> <li>detailed report</li> </ul>						

The datasets are now joined side-by-side using the common column. The top dataset is shown on the left. You can swap the vertical positions of the datasets to change the order in which they are joined.

If you just want to join row N of one dataset to row N of another dataset, you can use the <u>Row Num</u> transform to create a common column in each dataset.

Set **include top non-matching rows** and **include bottom non-matching rows** depending on what you want to do with top and bottom dataset rows for which there are no matches. If you only want one column from the second dataset you can use the Lookup transform.

If you want to find key values that are in one dataset but not the other (an 'anti-join') you can use the <u>Subtract</u> transform:

If you are merging numerical datasets you can also use an Interpolate transform.

See also: • Video: How to join Excel files

# 3.18 Move a .transform file

To move a .transform file to a different location on the same computer use **File>Save As...** or **Finder**. You either leave the Input files at the original location or move them to the same location relative to the .transform file (e.g. if they were in the same folder as the .transform file before, move them to the same folder as new .transform file).

To move a .transform file to a different computer, move the Input files to the same location relative to the .transform file (e.g. if they were in the same folder as the .transform file before, move them to the same folder as new .transform file).

See also <u>.transform files</u>.

# 3.19 Open multiple main windows

To open an additional Easy Data Transform Main window, select File>New Window.

# 3.20 Output nested JSON or XML

You can use the dot ('.') character in the column header to show nesting. For example:

name		carb	cholesterol	fiber	minerals.ca	minerals.fe	protein	sodium	vitamins.a	vitamins.c
1 Avoca	ado Dip	2	5	0	0	0	1	210	0	0

Is output to JSON as:

```
[
  {
    "name": "Avocado Dip",
    "carb": "2",
    "cholesterol": "5",
    "fiber": "0",
    "minerals": {
      "ca": "0",
      "fe": "0"
    },
    "protein": "1",
    "sodium": "210",
    "vitamins": {
      "a": "0",
      "c": "0"
    }
  }
]
```

#### And to XML as:

```
<?xml version="1.0" encoding="UTF-8"?>
<root>
  <record>
    <name>Avocado Dip</name>
    <carb>2</carb>
    <cholesterol>5</cholesterol>
    <fiber>0</fiber>
    <protein>1</protein>
    <sodium>210</sodium>
    <minerals>
      <ca>0</ca>
      <fe>0</fe>
    </minerals>
    <vitamins>
      <a>0</a>
      <c>0</c>
    </vitamins>
  </record>
```

</root>

For more details see:

- JSON format
- <u>XML format</u>

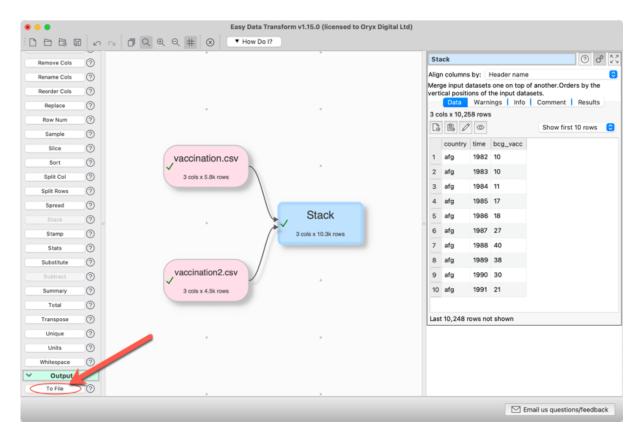

See also:

- Video: How to convert CSV to XML
- Video: How to convert CSV to JSON

## 3.21 Output to Excel

To output results from a transform to an Excel .xlsx/.xls file:

- Select the transform item in the **Center** pane.
- Click **To File** at the bottom of the **Left** pane.

• Select *.xlsx or *.xls from the file type drop-down list that appears.

	a second second long more that the second	 	
	✓ CSV file (*.csv)		
	Excel file (*.xlsx)		
	Excel file (*.xis)		
-	LITAL (le (* html)		

Note that Excel .xlsx files are typically limited to 1,048,576 rows and 16,384 columns.

See also:

- Write to multiple sheets of an Excel file
- Video: How to convert fixed column width to CSV or Excel
- Video: How to convert JSON to Excel
- Video: How to convert XML to Excel

# 3.22 Profile a dataset

In the **Right** pane you can double click on a column header or click the corresponding button to show a profile of the data in each column. For example the different data types (text, numeric etc) and the frequencies of different values. Potential discrepancies (such as missing values) are highlighted in red.

You can use profiling in conjunction with <u>Filter</u>, <u>Remove Cols</u> and <u>Replace</u> transforms to remove unwanted rows, columns or values; and with the <u>Impute</u> transform to add missing values.

# How do I?

	$ \langle - \rangle \rightarrow   \rightarrow   \uparrow \rangle$ Column V	↑ ↓ ↓ alues	
	Column V	alues	
	0	$\leftarrow$ $\rightarrow$ $\rightarrow$ Sample:	All 891 rows
ent values ᅌ	🗸 bars 🗸 %	include dates include s	tatistics
Frequency	7	Metric	Value
	644 / 72.28%	Empty values	2
	168 / 18.86%	Non-empty values	889
	77 / 8.64%	Numeric values	0
	2 / 0.22%	Integer values	0
		Real values	0
		Boolean values	0
		Text values	889
		Distinct values	4
		Unique values	0
		Duplicated values	4
		Min length	1
		Max length	1
		168 / 18.86% 77 / 8.64%	Frequency Metric   644 / 72.28% Empty values   168 / 18.86% Non-empty values   777 / 8.64% Numeric values   2 / 0.22% Integer values   8eal values Boolean values   Boolean values Text values   Distinct values Distinct values   Duplicated values Min length

For large datasets you might want to set **Sample** to less than the full dataset for speed. You can also leave **include dates** and **include statistics** unchecked for speed (**include dates** checks against every date format listed in **Preferences**).

See also:

- Video: How to profile data
- Summary
- Add missing data values
- <u>Clean a dataset</u>

#### 3.23 Perform the same transforms on many files

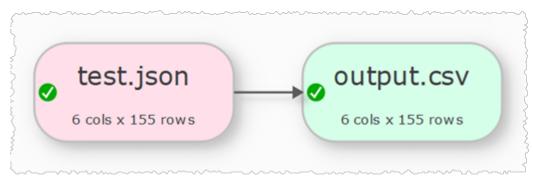

You can perform the same set of transforms on multiple inputs in one operation using <u>batch</u> <u>processing</u> or <u>command line arguments</u>.

#### **Example 1**

To convert a folder full of .json files to .csv files:

1. Select **File>New** to create a new .transform file.

3. Click on the **To File** button at the bottom of the **Left** pane and set the location of a .json file to create. Ensure the options (encoding etc) are correct in the **Right** pane.

- 4. Select File>Batch Process.
- 5. In the **Batch Process** window change the .json file name to *.json, so that all the .json files in that folder will be processed.

E Batch Process*							
Input locations can include wildcards and Excel sheet names: E.g. 'C:\Users\andy\Documents\output_*.csv' or 'C:\Users\andy\Documents\output_data.xlsx[*]'. Output locations can include variables {test}, {date}, {time}, {datetime}: E.g. 'C:\Users\andy\Documents\output_{test}_{datetime}.csv'. Where {test} is replaced with the file stem of the input with alias 'test'. And {datetime} is replaced by the processing date and time. Click 'Help' for more details. Add Remove Clear							
Input alias=test		Output alias=output (Overwrite)					
1 C:\Users\andy\Desktop*,json		C:\Users\andy\Desktop\output_{test}.csv					
Proces	ss	Stop					
		Close Help					

6. Press the **Process** button. A .csv file will now be created for each .json file in the folder. In the example above the {test} file name variable will be replaced by the file name of the input file with alias test (if you just output to output.csv then you would be continually overwriting the same file).

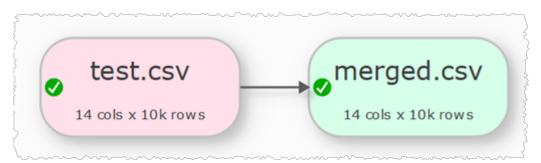

7. Select File>Save to save your .transform for future use.

If you want to process input files from another folder then click **Add** to add a new row and change the input folder.

## Example 2

To merge multiple .csv files into a single .csv file:

- 8. Select **File>New** to create a new .transform file.
- 9. Drag one of the .csv files onto the **Center pane**. Ensure the options (encoding etc) are correct in the **Right** pane.
- 10.Click on the **To File** button at the bottom of the **Left** pane and set the location of a merged.csv file to create, in a different folder to the input .csv files. Ensure the options (encoding etc) are correct.

4. In the **Right** pane set **Write Mode** to **Append** and check **write header** and **if empty**. This ensures that only one header will be written, rather than one for every input file.

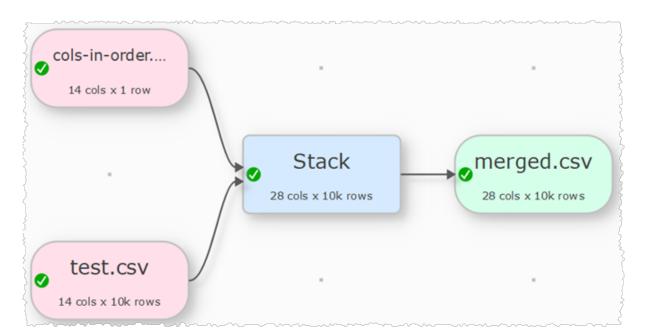

merged.csv	v							
Output to file.								
File:	C:\Users\andy\Desktop\merged.csv							
Туре:	Delimited text							
Delimiter:	Delimiter: Comma (,)							
Quoting:	As needed							
Line endings:	e endings: Automatic							
Encoding:	UTF-8							
	V Byte Order Mark							
Write mode:	Append	*						
	$\checkmark$ write header $\checkmark$ if file empty	'						
Alias:	merged							

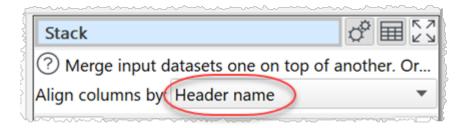

- 5. Select File>Batch Process.
- 6. In the Batch Process window:
- change the input .csv file name to *.csv, so that all the .csv files in that folder will be processed.
- Check **clear 'Append' outputs before first append** so that any existing data in the output file is cleared before Easy Data Transform start appending to it.

E Batch Process*			×					
Input locations can include wildcards and Excel sheet names: E.g. 'C:\Users\andy\Documents\output_*.csv' or 'C:\Users\andy\Documents\output_data.xlsx[*]'. Output locations can include variables {test}, {date}, {time}, {datetime}: E.g. 'C:\Users\andy\Documents\output_{test}_{datetime}.csv'. Where {test} is replaced with the file stem of the input with alias 'test'. And {datetime} is replaced by the processing date and time. Click 'Help' for more details.								
Add Remove Clear V clear 'Append'	Add Remove Clear V clear 'Append' outputs before first append							
Input alias=test		Output alias=merged (Append)						
1 C:\Users\andy\Desktop*.csv		C:\Users\andy\Desktop\merged.csv						
Proce	SS	Stop						
		Close	Help					

- 7. Press the **Process** button. A single merged.csv file will now be created that contains a concatenation of all the other .csv files.
- 8. Select **File>Save** to save your .transform for future use.

If the headers are different orders in different .csv files, then you can <u>Stack</u> by header name in your .transform to get a consistent column order before outputting.

# 3.25 Run jobs on a schedule

Easy Data Transform doesn't currently have it's own scheduler. However you can run jobs on a schedule (e.g. at 5pm every day) by using pretty much any scheduler to call the Easy Data Transform <u>command line interface</u>:

- 1. Create the .transform file that details the transformations you want to carry out.
- 2. Call Easy Data Transform command line interface (or a script that calls the command line interface) from your scheduler.

You can use launchd, which is part of macOS (but not very friendly). Or you can use any number of third party scheduler applications , such as LaunchControl.

You can change the input and output file names through the command line interface. Add – cli to close Easy Data Transform after the job is finished.

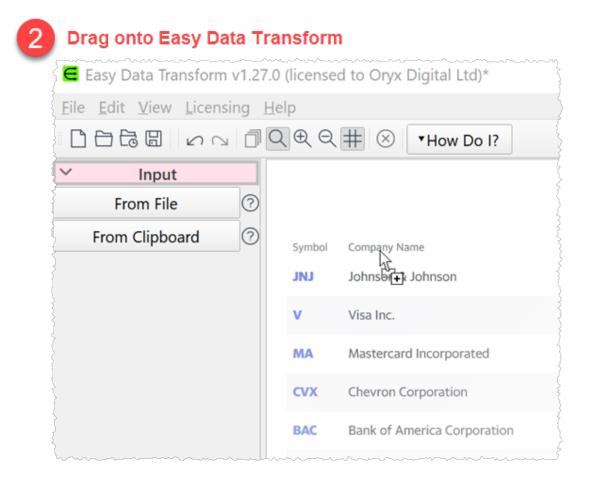

Some schedulers will also allow you to call Easy Data Transform on an event, e.g. when a file is added to or updated in a particular folder.

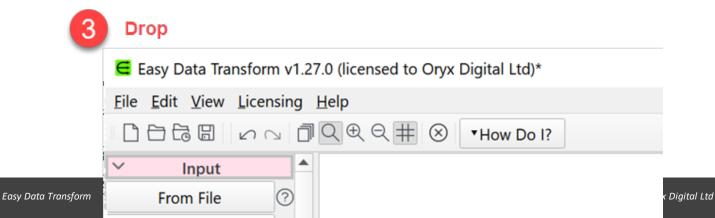

# 3.26 Scrape web data

You can scrape data from a web browser by selecting it and dragging into the **Center** pane of Easy Data Transform (or copying and clicking **From Clipboard**).

# Select data in web a browser

	Symbol	Company Name	Last Price	Change	% Change
{	INJ	Johnson & Johnson	181.54	-1.82	-0.99%
المراجد المراجد	V	Visa Inc.	208.17	-8.28	-3.83%
Į	MA	Mastercard Incorporated	351.18	-13.26	-3.64%
	cvx	Chevron Corporation	160.95	- <b>3.63</b>	<mark>-2.21%</mark>

See also:

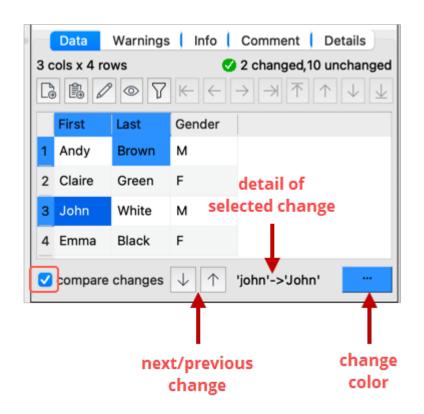

• Video: How to scrape web data

# 3.27 See changes from a transform

The following transforms allow you to highlight changes made by the transform:

- <u>Case</u>
- Chop
- DateTime Format
- <u>Decode</u>
- Extract
- <u>Fill</u>
- <u>Hash</u>
- Impute
- Insert
- <u>Number Format</u>
- <u>Offset</u>
- <u>Pad</u>
- <u>Replace</u>
- <u>Scale</u>
- <u>Unfill</u>
- <u>Units</u>
- Whitespace

Check the **compare changes** checkbox below the data table to highlight changes made by the transform.

Click on or hover over a cell to see details of each change.

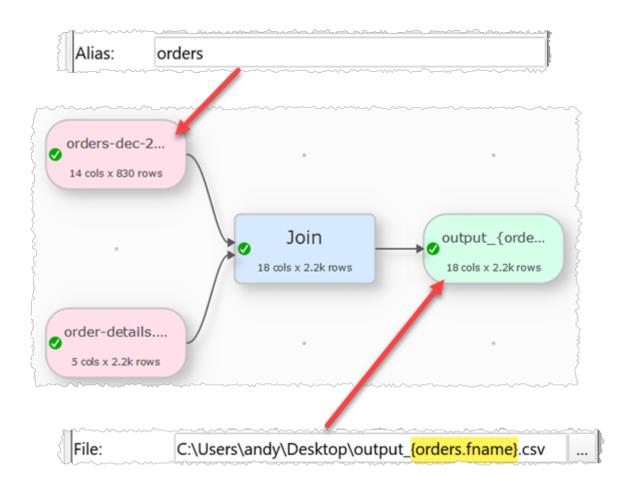

Click on the up and down arrows to move between changes. Changes hidden by dataset filtering are skipped.

If you want to see rows that were removed by a transform such as <u>Dedupe</u>, <u>Unique</u> or <u>Filter</u>, you can do that using <u>Subtract</u>. The dataset needs to have a column of unique key values to use in the **Subtract**. If it doesn't have one, then add one first using <u>Row Num</u>.

orders.csv 14 cols x 913 rows	Row Num	Dedup 15 cols x 830		Subtract 15 cols x 83 rows
		Subtract		♂ ■ ∑
	4	Remove rows from the second	om the top datase	t whose key val
	Ę	Top key column:	Row Num	•
		Bottom key column:	Row Num	•
	1		✓ case sensitive	

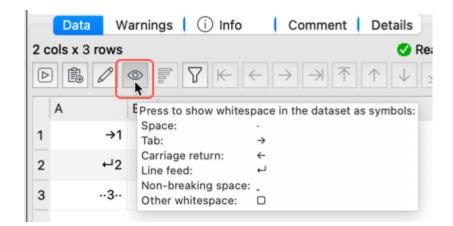

# 3.28 Set output file name from input file

To set an output file name based on the name of one or more input files, see <u>File name</u> <u>variables</u>.

# 3.29 Show whitespace

Click the eye icon in the **Right** pane to show whitespace in the data.

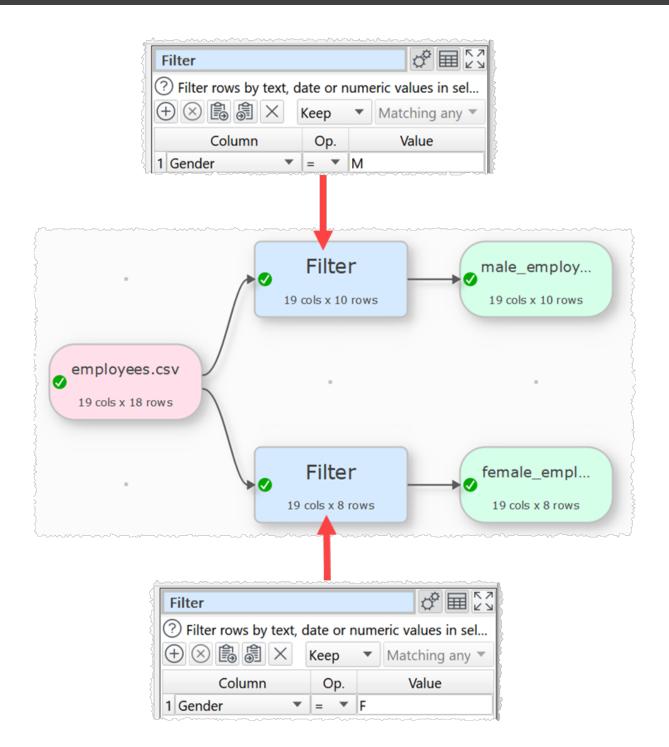

# 3.30 Split a dataset into multiple files

Easy Data Transform supports splitting datasets into multiple files in 2 different ways.

# **Example 1: Simple splitting**

To split a dataset according to whether the Gender column contains M or F, use a pair of <u>Filter</u> transforms.

# **Example 2: Split according to row values**

To split a dataset according to Region column values:

• Use transforms (such as <u>Substitute</u>) to create a column with the file location you want to output to, based on the Region column. The location can be an absolute path (e.g. /Users/andy/output.csv) or a path relative to the .transform file location (e.g.

results/output.csv). Folders output to must already exist. Empty or invalid values are ignored. This column is not output (use the **Copy Cols** transform if you want it to be).

- Create an output with **Output to** set to **Multiple files** and the **Files column** selected.
- Set Confirm files checked to be prompted before writing (recommended).

# **Example 3: Split by size**

To split a dataset into files of 1000 rows each:

					~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~	
		Multiple fil	es	¢ I	■ []	
		⑦ Output to	file.			
		Output to:	Multiple files		-	
Row Num	♂■23	Files column:	File name		-	
? Add a new column with the row		Confirm files:				
Start at: 1		Туре:	Excel XLSX		•	
		Formatting:	Automatic		-	
Increment: 1	▼	Write mode:	Overwrite	 Sheet 	-	split-1.xlsx
Every: 1000	\$		✓ write header			🛯 split-2.xlsx
					-0.010 %	🔊 split-3.xlsx
		~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~				💴 split-4.xlsx
10k.csv	Row Num	Substitute		Multiple file	5	split-5.xlsx
14 cols x 10k rows	15 cols x 10k rows	16 cols x 10k rows		16 cols x 10k rows		split-6.xlsx
		www.enternee	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~		- s	split-7.xlsx
						split-8.xlsx
	Substitute		¢ 🖬 🏾	7		split-9.xlsx
	② Substitute col	umm volvos into t		И		split-10.xls
	New column name		ext.			
	Substitution script			-12		
	output\split-s		x			
				W		

See also:

• Video: How to split CSV into multiple files

#### 3.31 Trigger an update when an input changes

Check watch file in the Right pane for an input file if you want to trigger processing (Run>Auto Run checked) or set it to 'Needs update' (Run>Auto Run unchecked) whenever the input file changes.

#### Note:

- If you are also outputting to this file in the same .transform you are inputting it, it may cause the .transform to run forever.
- The update may not be triggered if the file is deleted and replaced with a new file with the same name.

#### 3.32 Use Easy Data Transform from a USB key

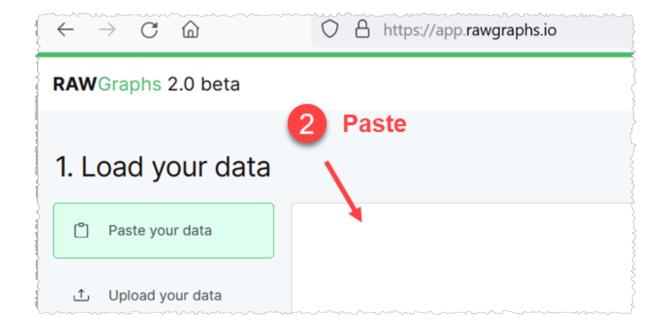

See **Portability**.

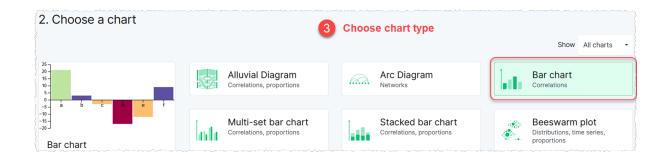

#### 3.33 Visualize data

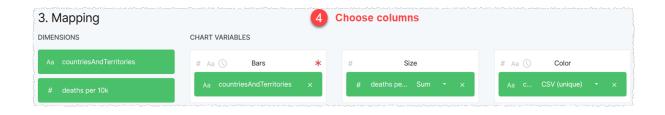

Currently Easy Data Transform does not support charting beyond <u>data profiling</u>. However it can easily integrate with other tools that do. For example. by outputting a CSV for import into the visualization tool, or copying and pasting via system clipboard.

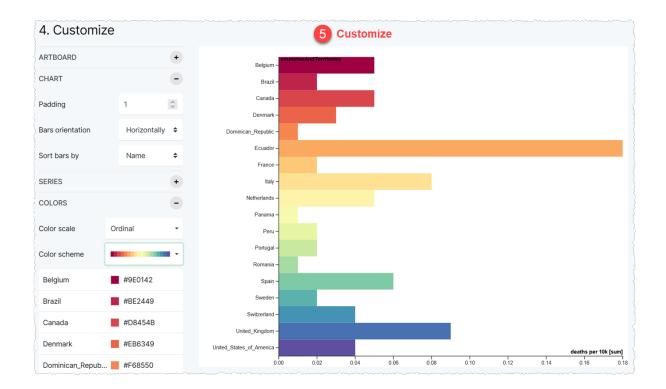

For example, you can copy and paste data direct from Easy Data Transform to rawgraphs.io:

D	ata	Characters	Warnings	Info	Comm	ent	Details
countriesAndTerritories				3	deaths	per	10k
1	Ecuador 0.				0.18		
2	2 United_Kingdom					0.09	
3 Italy					0.08		
4	Spa	in					0.06
5	Net	herlands	~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~~			·····-	0.05

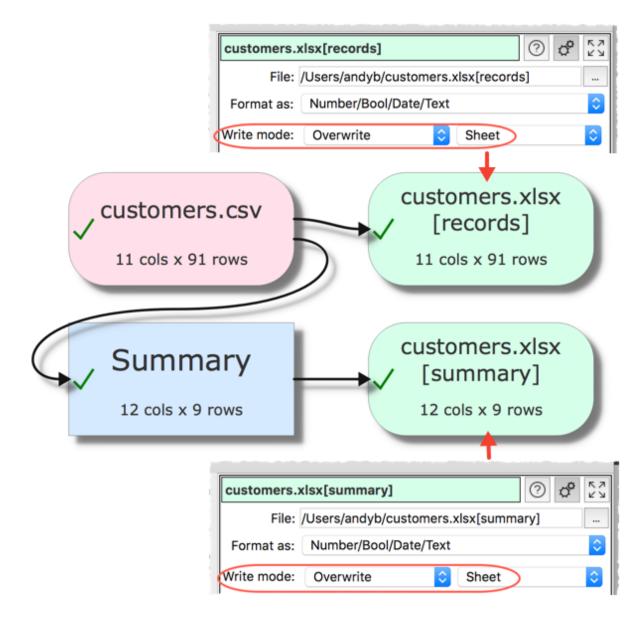

#### See also:

• Video: How to visualize data with rawgraphs.io

# 3.34 Write to multiple sheets of an Excel file

To write to multiple sheets (tabs) of the same Excel file you need to set the **Write mode** of each output item to **Overwrite/Sheet** (to clear the sheet first) or **Append** (to add to existing sheet data).

If you set the **Write mode** to **Overwrite/File** for an item then the write will remove existing sheets.

**Expert tips** 

# 4 Expert tips

# 4.1 Expert tips

.

Here are some tips to help you be more productive with Easy Data Transform.

1. Type a keyword in the transform keywords field to quickly find the right transform.

~	Transform	ı
All t	ransforms	0
√ sho	w advanced	
Qg	roup	8
	Gather	?
	Unique	?

2. To add a transform click an existing **Center** pane item and type the first few letters of the transform name.

~	COVID-19-geo [COVID-19-ge 11 cols x 13.7k rows	

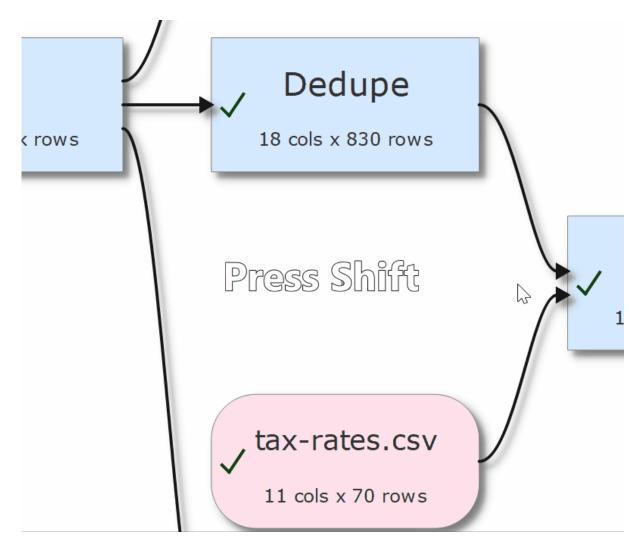

3. Check the **show advanced** checkbox in the **Left** pane to see all available transforms.

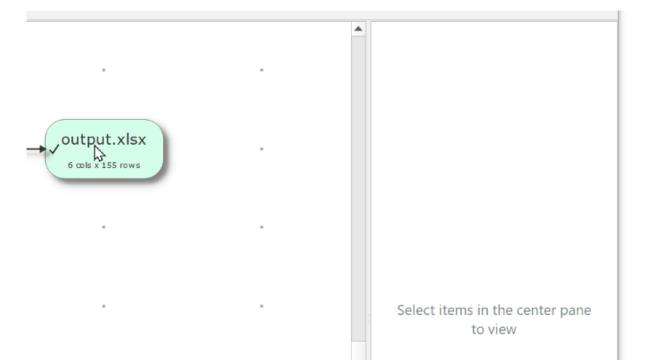

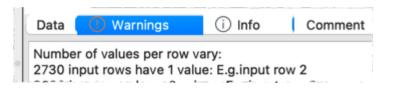

5. Hold down the Shift key and drag on the **Center** pane to scroll left/right/up/down.

6. Use Note items to remind yourself how a complex .transform works.

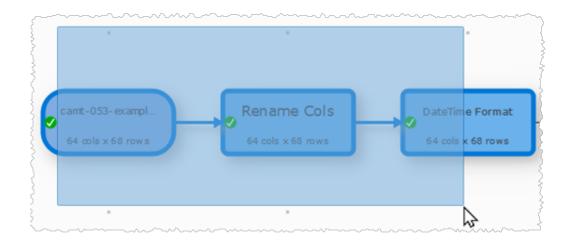

7. Look in the **Warnings** and **Info** tabs in the **Right** pane to troubleshoot potential issues.

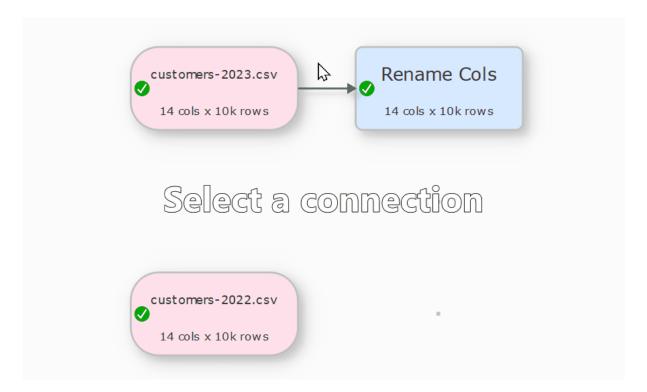

8. Click on icon in the status bar to select and zoom in on all items with that status.

9. To select multiple items in the **Center** pane, left click with the mouse and drag a box over the items you want to select.

10. Try to avoid disconnecting transforms, as this can reset column related options downstream. Add a transform to an existing connection instead. You can also delete a transform without deleting it's connections.

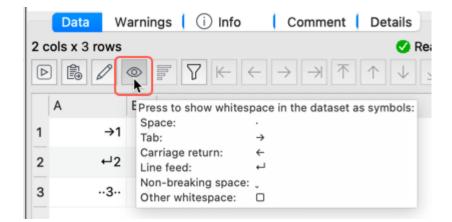

11. To improve performance for large datasets, add a <u>Sample</u> transform straight after the input of a large dataset and set **Rows** to pass through only the first 100 or so rows. Once you have completed all your transforms you can then **Disable sampling** to pass through all rows.

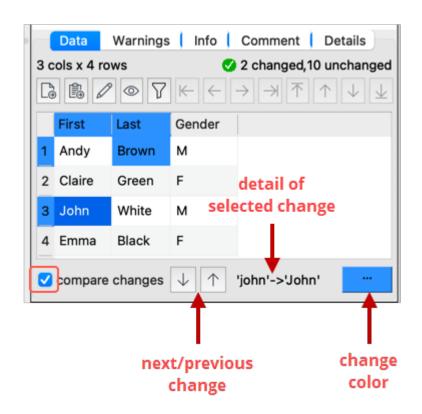

12. Check View>Timing Profile to see where the processing time is being spent.

10k.csv 14 cols x 10k rows			
Stack	Filter 14 cols x 81.5k rows	Sort 14 cols x 81.5k rows	output.csv 14 cols x 81.5k rows
100k.csv 14 cols x 100k rows			

13. Click the eye icon in the **Right** pane to show whitespace in the data.

14. Check **compare changes** in the **Right** pane to <u>see changes from a transform</u> (selected transforms only).

15. Select a column and click the bars icon in the **Right** pane to show the frequency of values. Potential issues are shown in red.

### Expert tips

cols x 891 rows		$\leftarrow \rightarrow \rightarrow $	✓ Read ↑ ↓ ↓

4											•

17. Filter data in the **Right** pane.

Data	Warnings	Info	Comm	nent	Details	
11 cols :	x 14,658 rows	L				Rea
e e	dateRep	day	month	year	cases	√ ⊻ dea
1	2020-05-03	3	5	2020	134	
2	2020-05-02	2	⇒ ₅	2020	164	
3	2020-05-01	1	5	2020	222	
4	2020-04-30	30	4	2020	122	
5	2020-04-29	29	4	2020	124	

18. Display the currently selected value from in the data table in a separate window by pressing the Space key or selecting **Show Value...** from the right click menu.

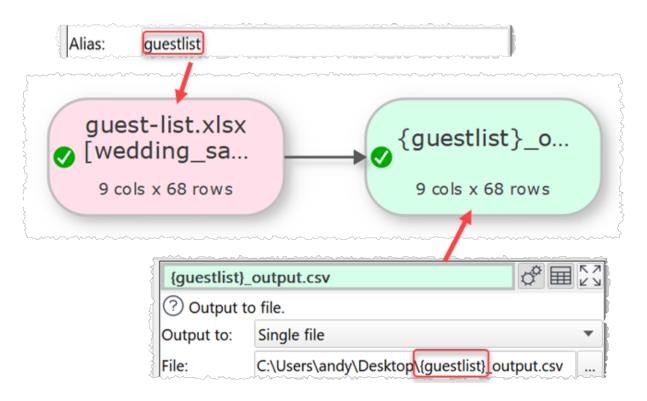

19. If you need several similar branches of transforms you can create one branch and <u>duplicate</u> it.

20. If you have 2 or more monitors connected to your computer try **View>Two Screen Mode** to show the **Right** pane on your second monitor.

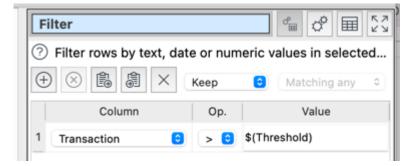

21. Use <u>batch processing</u> with wildcards (e.g. *.csv) to process a folder full of input files in one operation.

22. Use <u>command line arguments</u> to run .transform files from a batch or script file.

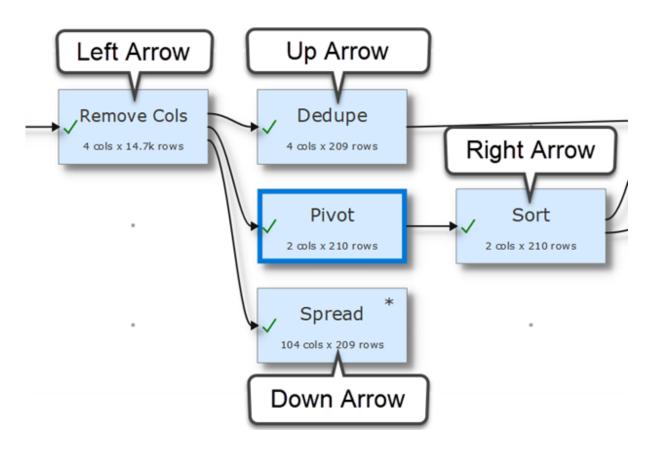

23. Use <u>file name variables</u> to set the name of an output file based on the name of an input file, date created etc.

24. Use <u>column variables</u> when you want to use values from columns in transforms such as <u>If</u> and <u>Filter</u>.

25. Learn <u>keyboard shortcuts</u>. For example, you can quickly change selection in the **Center** pane using arrow keys with the Cmd key.

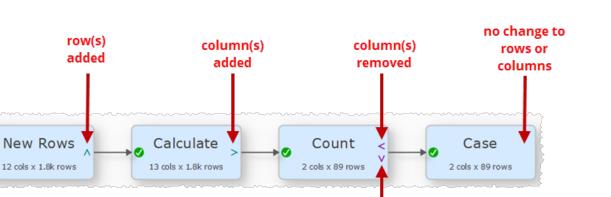

26. Change focus between the Center and Right panes using Option+[ and Option+].

27. Check the **gray Left pane buttons when not available** checkbox in the **General** tab of the **Preferences** window for **Left** pane buttons to be disabled until the appropriate items in the **Center** pane are selected.

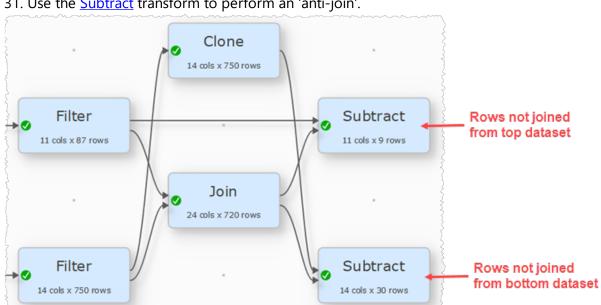

28. Double click on an item in the **Center** pane to show it fullscreen. Escape to close the window.

29. Check **watch file** in the **Right** pane for an input file if you want to trigger processing (**Run>Auto Run** checked) or set it to 'Needs update' (**Run>Auto Run** unchecked) whenever it changes.

30. Check **View>Show Row/Col Changes** to show changes in the number of rows and columns in the **Center** pane.

row(s) removed

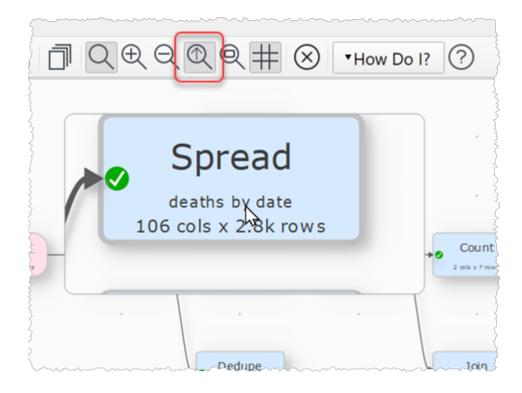

31. Use the Subtract transform to perform an 'anti-join'.

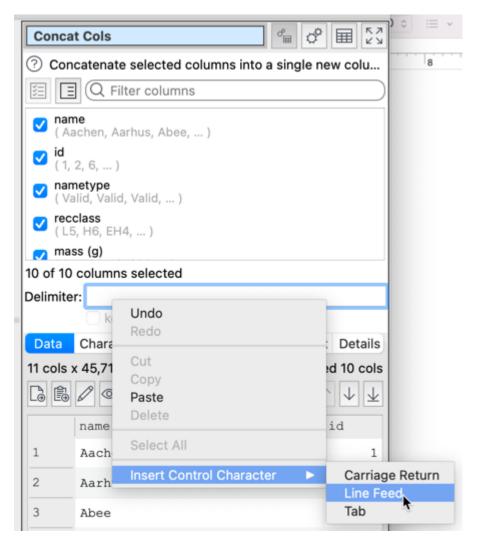

32. Deploy Easy Data Transform as a portable application so you can run it from a USB key or install it on computers where you have limited access rights.

33. Find items matching one or more search terms in the Center pane using View>Find Items.

34. Magnify under the cursor in the **Center** pane using **View>Magnify Cursor**.

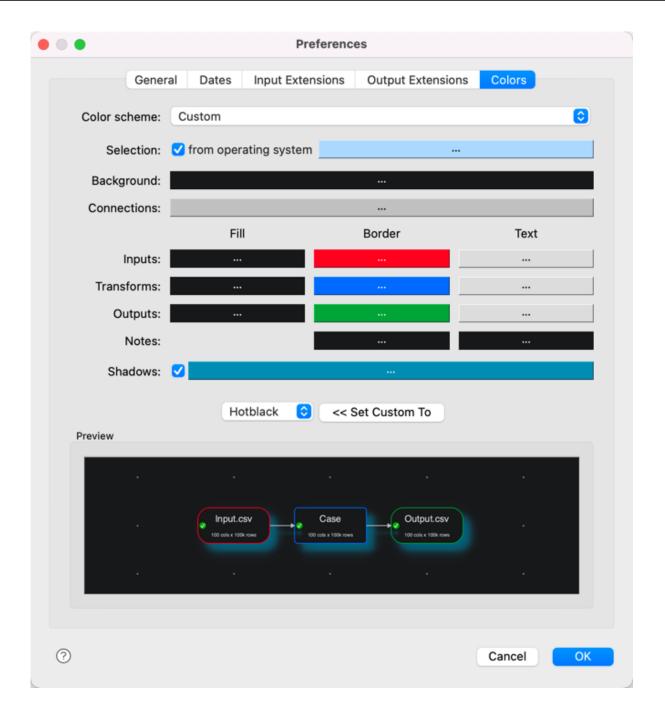

35. Use the right click menu to insert control characters into a text option for a transform.

36. Use <u>fuzzy matching</u> to match text values that aren't identical.

37. Experiment with changing **Optimize processing for** from **Minimum memory use** to **Maximum speed** in **Preferences** to see if that improves performance. It may be slower or it may use up all your memory.

38. Change the **Center** pane color scheme in the **Colors** tab of the **Preferences** window.

39. Select View>Toggle UI Theme to swap between light and dark user interface themes.

# Support

#### 5 Support

#### 5.1 Forum

There is a discussion forum online at <u>forum.easydatatransform.com</u>. You can use this to ask questions, share what you are doing and keep up to date with news.

#### 5.2 Contact support

If you have any questions or suggestions, please post a question on <u>forum.easydatatransform.com</u> or email us at <u>support@easydatatransform.com</u>.

#### 5.3 Report a bug

Please report any bugs you find to <a href="mailto:support@easydatatransform.com">support@easydatatransform.com</a> Please include:

- your operating system (e.g. macOS 12)
- the version of Easy Data Transform (from Easy Data Transform>About Easy Data Transform)
- a step-by-step description of how we can reproduce the problem
- your .transform file and input data files (where appropriate)
- a screen capture or video can often be helpful

The step-by-step description is particularly important - if we can't reproduce your problem, then we probably won't be able to fix it.

We treat all data sent to us as confidential, unless you tell us otherwise. If your data is particularly sensitive, it might be enough to send us just the first few rows with sensitive values changed. Keep the same column structure though.

#### 5.4 Request an enhancement

We are always very interested to hear your suggestions on how the software can be improved. Please post a feature suggestion on our <u>forum.easydatatransform.com</u> or email us at <u>support@easydatatransform.com</u>.
